# ARMOURED DOORS

## A STEEL SHEATHED WOODEN DOOR WHICH IS FIREPROOF.

ACCEPTED & RECOMMENDED by ALL INSURANCE CO.'S

WILL NOT BUCKLE  
OR WARP LIKE  
THE ORDINARY IRON  
DOORS.

CAN BE FITTED  
WITH AUTOMATIC  
SELF-CLOSING  
ATTACHMENT.

HAS STOOD THE MOST SEVERE TESTS IN THIS COUNTRY.  
FIRE AT THE WORKS OF THE ANAGLYPTA CO., DARWEN, LANCASHIRE.

The door we fitted in these works, although subjected to a heat intense enough to melt brass taps and fittings near it, withstood the heat perfectly, and can now be inspected at our works in Manchester, fit for duty. The metal sheets have expanded without becoming detached, whilst the wood is simply charred to a depth of about ½ of an inch.

AN interesting discovery has just been made at Pope's Villa, Twickenham. The house, it is known, stands on or near the site of the house where lived Alexander Pope, but the exact location has not been known until the discovery by some workmen of an old stone, hidden by some masonry. This stone bears the inscription, "On this spot stood until 1809 the house of Alexander Pope. The grotto that formed its basement still remains."

THE new Cottage Hospital, Newton Abbot, is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues, by Messrs. E. H. Shorland & Brother, of Manchester.

MESSRS. B. FINCH & CO. are issuing their supplement to "Finch's Diary for Architects and Surveyors for 1897," which supplement contains notes, &c., on Plumbing, Evils of Bad Plumbing, Hospital Fittings, Tables for Guidance of Plumbers, Regulations of the Metropolitan and Local Water Companies, Regulations for Registration of Plumbers, &c.

**ELECTRIC NOTES.**

THE electric-light works erected by the Harrogate Corporation about a mile outside the town were opened on the 14th inst. by Colonel Thwaites, chairman of the electric-lighting committee. The Corporation start operations with ninety customers, and in the course of the opening proceedings a confident belief was expressed that the undertaking would ere long be a financial success. The works and installation have cost 25,000*l*.

THE Board of Trade have decided to grant provisional orders to the Reigate Corporation and the Urban District Council of Dorking empowering them to supply electricity within the area of their respective jurisdictions. For this purpose the Reigate Corporation are empowered to spend 15,000*l*., and the District Council of Dorking 10,000*l*. The Board have also granted an electric-lighting order to the Barking Town Urban District Council, who are authorised to expend 15,000*l*. The provisional orders will require confirmation by Parliament before they become operative.

**BUILDING AND BUILDERS.**

A NEW town hall is to be erected for the borough of Conway.

A CHURCH is shortly to be erected at Handforth, near Wilmslow.

IT has been decided to erect a granite obelisk on the Cliffe Hill to the memory of the Lewes martyrs. The memorial will be about 40 feet high, and will entail an expense of about 400*l*.

THE foundation-stones of a new Wesleyan chapel at Ham Green were laid on Tuesday last. The cost of the building will only be 226*l*.

THE 400th anniversary of Cabot's discovery of the North American mainland is to be commemorated in Bristol by the erection of an observatory tower on Brandon Hill, at a cost of 3,000*l*.

THE Rugby Urban District Council have just completed the purchase from Mr. B. H. C. Fox, for 8,000*l*., of eighty acres of land on the north side of the town, chiefly for sewage disposal purposes.

THE Carlisle Town Council have decided to erect a number of workmen's dwellings, at a cost of 2,250*l*., and to have plans prepared for a scheme for lighting the town with electricity, the cost being estimated at 25,000*l*.

THE present vestry hall at Paddington has long been inadequate to public requirements, and it is now proposed to build a handsome and spacious town hall, which will meet the necessities of the growth and be worthy of the importance of the parish.

A NEW extension of the abbey at Crowland is to be carried out, and the foundation-stone has just been laid for the new work. The rector, the Rev. T. H. Le Boeuf, is prominently interesting himself in the undertaking, as he has done in the previous restoration work at Crowland Abbey.

MR. WILLIAM BYRNE, who has been selected as architect for the proposed new church of Teremore, co. Dublin, has submitted plans which have been approved by his Grace the Archbishop. The church will be of the Romanesque style, with nave, side aisles and transepts, and Mr. Byrne calculates that the expense of the church without the spire will be about 12,000*l*.

THE Commissioners of Govan have again considered the competitive designs of the proposed municipal buildings for the burgh. The reports of the experts were adopted unanimously, and the premiums—100*l*., 50*l*. and 25*l*.—were awarded as follows:—First, Messrs. Thomson & Sandilands, 241 West George Street; second, Messrs. Dykes & Robertson, 65 West Regent Street; third, Mr. W. H. Howie, 131 West Regent Street. On Thursday, the 15th inst., the plans were on exhibition in the Robert Street Hall, and from the 20th until the 24th inst. the successful design will be on view in the Burgh Chambers, Albert Street.

**TO PREVENT CISTERNS AND PIPES FREEZING.****THE UNIVERSAL LAGGING COMPANY, LIMITED,**

Supplies an unequalled composition for Coating Cisterns and Pipes, preventing the formation of Ice in Cisterns, and the Bursting of Pipes in Private Houses and Public Buildings; Refrigerators and Refrigerating Sheds. Lining Corrugated Iron and Wooden Buildings, also Boilers (Marine and Stationary). Used by the Admiralty, and the leading Water Works Companies.

Portable Cistern Filters.

IN Boston (U. S.) it has been decided to lay a 12-inch salt-water pipe-line, for fire protection only, in a portion of the city containing many warehouses and office buildings, and regarded by fire-engineers as presenting special hazards. In case of fire in the district near the line of pipes, the city fire-boat is, to be utilised to force water into the pipe, and special hydrants will render the new supply available for the fire-engines.

## VARIETIES.

A NEW temporary iron church dedicated to St. Andrew, which has been erected as a mission in connection with St. John's

THE engine-house and machinery shed at the brickworks of the Scottish Terra-Cotta and Metallic Brick Company, Limited, situated at Braidwood, near Carlisle, were on the 15th inst. discovered to be on fire. Efforts were at once made by the workmen to extinguish the fire, but all the measures taken to extinguish the conflagration were unavailing. The damage is estimated at 3,000*l*.

Telegraphic Address, "WELL SPRING, MANCHESTER."

for Banks, Warehouse and Newspaper Offices. It is used at the London and County Bank, the Eastern Office and at the Alliance Bank, London and Lancashire Office, and at Messrs. George Newnes & Co.'s Newspaper Offices. These Trolleys are supplied with Rubber Corners to avoid collision with doors, fittings, &c., and can be placed in lift with handles and wheels. It is also used for the application of Sole Manufacturers, J. REAP & Co. Engineers, Confounders, and Pattern Makers, 16 Colindale Street, Southwark, S.E.

THE Archbishop of Canterbury, on the 13th inst., unveiled two stained-glass windows in the triforium in the north transept of Canterbury Cathedral. One is the gift of Mrs. Robertson in memory of her late husband, Canon Robertson, the distinguished Church historian; and the other was given by an anonymous donor. As in the case of the remaining windows on this side of the choir, the subjects of the new windows are taken from the Old Testament. Dean Farrar said that the windows were the first decorative work carried out in connection with the thirteenth-centenary commemoration.

A BEAUTIFUL old Jacobean pulpit of carved oak, which formed part of the appointments in the Archbishop's Chapel at Bishopthorpe, has been presented by the Primate (the most Rev. Dr. Maclagan) to Mrs. Goodwyn, by whom it has been set up in the parish church of Rotherfield, Sussex, "in loving memory of the most Rev. William Thomson. D.D., Archbishop of York from 1863 to 1890." Mrs. Goodwyn is the eldest daughter of the late Archbishop Thomson, and her husband, the Rev. Frederick Wildman Goodwyn, M.A., of Brasenose College, Oxford, Canon and Prebendary of York, is rector of Rotherfield.

A SERIOUS accident occurred at the Phoenix Bessemer Steel Works, owned by Messrs. Steel, Peech & Tozer, Limited, on Tuesday morning. Work had been suspended during the Easter holidays, but had been resumed that morning at six o'clock. Three blows had proceeded all right, and the fourth was just beginning when the explosion occurred. The pipe, which is necessarily of large dimensions, gave way at a point near the blowing engines in the engine-house, and so loud was the report caused by the fracture that it was heard at least a mile distant. A good deal of damage was done to the engine-house, and unfortunately several of the workmen were seriously injured.

THE Glasgow Institute of Architects have now on exhibition at their rooms a selection of drawings submitted for the various prizes and studentships offered by the Royal Institute of British Architects that annually are sent on tour among the affiliated societies. There are architectural designs, measured drawings of old work, pencil sketches and colour studies. For the first the chief prize of the British student is offered—the Soane Gold Medallion, and 100*l.* to be spent on travel for the study of past work—and this is the condition attached to nearly all the other and lesser money prizes. The score or so of drawings are but a sixth of the number submitted, and, selected as the best of their various kinds, are worth study.

THE tenders for the great extension of Ostend harbour and docks, which was provisionally estimated to cost nine millions of francs (360,000*l.*), were opened on the 20th inst. at the offices of the Provincial Government at Bruges, before Baron Ruzette, Governor of the Province. One-half of the cost is to be paid by the town of Ostend and the remainder by the Belgian Government. There were three tenders only—that of a firm at Roulers, West Flanders, 9,435,800 francs; a Bruges firm 9,470,000 francs, and a Paris firm 12,340,030 francs. The tenders will be submitted to the Government at Brussels for final decision. The works include the extension of the outer harbour, the building of a sea wall 850 yards in length, a new dock with 3,000 yards of quay space, bridges, alteration to roads, &c.

### NEW CATALOGUES.

MESSRS. BENNETT'S Ironfoundry Company, of Hyde Road, Manchester, are sending out a strongly bound and well-printed and illustrated catalogue of registered designs of the "Biclam" cast-iron sanitary lavatory stands and ranges, with earthenware basins, suitable for dwelling-houses of all classes, clubs, schools, &c. These designs offer immense variety with a corresponding diversity of price. The "Biclam" cast-iron stands offer the following advantages over wood casings. They do not harbour dirt to the same extent, they are more easily got at, so that any leakage can be readily detected, while there is also greater freedom for cleaning, executing repairs, &c. They are much cheaper and quite as serviceable. They can be easily decorated to harmonise with the surroundings. They are made for every style and every size of earthenware lavatory basin that is in the market, and are very easily fixed.

### RECORD REIGN INVENTIONS COMPETITION.

MESSRS. RAYNER & Co., of 37 Chancery Lane, are conducting for the *Western Mail*, of Plymouth, the Record Reign Inventions Competition. The first subject is "A New Window Fastener." The first prize will be in cash for the sum of 15 guineas; the second prize is a complete patent, value 12 guineas; the third prize is a provisional protection, value 4 guineas. (a) All inventions must be original and practical in their working, and although models are not essential, the particulars forwarded should in all cases be so clear that there can be no possible

misconception of the ideas, and competitors are strongly advised to direct their attention to the simplicity and cheapness of the fastener. The judges will take mostly into account the simplicity and usefulness of the article, coupled with the cheapness of manufacture, and their awards will be absolutely final. (b) All inventions must bear the date of provisional protection or patent application after April 8, 1897. Old patents will not be eligible. The executive of the *Western Mail* have decided upon condition (b) entirely in the interests of the competitors. The reason for this decision is twofold. It safeguards the inventor's interests, reserving to him the exclusive control of his invention, and it relieves the executive of the *Western Mail* from a most serious responsibility. Every effort will, of course, be taken to conduct this competition in the most private manner, but the securing of the provisional protection or patent from the Patent Office will safeguard inventors in every respect. The competition will close about the middle of June. All models, explanations and drawings must be sent, carriage paid, to Messrs. Rayner & Co., Patent Editors to the *Western Mail*, 37 Chancery Lane, London, and must be marked boldly in the left-hand corner "Record Reign Invention Competition." Any further particulars that may be required will be forwarded by Messrs. Rayner & Co., to whom all inquiries should be addressed.

### AN ELECTRIC METER PATENT.

JUDGMENT was given by Mr. Justice Wills, on the 10th inst., in an action of considerable interest, whereby Messrs. Chamberlain & Hookham, of Birmingham (makers of the "Hookham" meter), sought to restrain Messrs. Johnson & Phillips, of Charlton, from manufacturing and selling the "Perry" meter, which was alleged to infringe the patent granted to Mr. George Hookham in 1887.

It was urged for the defence that any parts of the "Perry" meter which might be considered an infringement of Mr. Hookham's patent were of general knowledge before 1887, the date of that patent; and further, that a patent granted to Professors Ayrton and Perry in 1882 anticipated it.

It may be mentioned that both these meters are of the motor type, in which type the speed of the motor is proportionate to the amount of energy passing through the meter, and to ensure that the motor will run at a speed proportionate to the current the braking effect must be proportionate to the speed.

Mr. Justice Wills, in delivering judgment for the plaintiffs, stated:—It has been urged upon me that the decision I have arrived at will involve upon Professor Perry, one of the patentees of 1882, great hardship, inasmuch as the defendants are his licensees, working under a patent of 1890, and that it is a strange thing that one of the two men who laid down the correct theory and indicated the lines upon which to work should be thus "hoist with his own petard." I am very truly sorry if my decision does involve hardship, but I cannot help the conclusions I have arrived at. They seem to me, after the most serious consideration, to be the right ones, after which there is no more to be said. But it is well-known law—no intelligent patentee can be ignorant of it—that in order to give right to a monopoly the patentee must not merely set a problem and even render it not very difficult to solve, but must descend to practical details, so that at the expiration of the patent the rest of the world may be able without further experiment to make the patented article. This condition, I think, Messrs. Ayrton and Perry did not fulfil, and, if so, they cannot complain that another should travel by the road they have discovered up to the door which they did not unlock, and, having found the key himself, should unlock the door, go in, and shut them out.

### WM. WALLACE & CO.

WE learn that an important section, both at the Crystal Palace and the Victorian Era Exhibition, Earl's Court, is to be set aside for the benefit of those who make a point of having their homes furnished as comfortably, artistically and inexpensively as possible. One of the principal exponents in this class will be the well-known firm of Wm. Wallace & Co., of 151 to 155 Curtain Road, E.C., who have for several years past made a specialty of this class of furniture. Some of these rooms will be arranged by one or other of the lady writers in the Society papers who make a careful study of decorative effect.

An effort will also be made by this firm to show some of the earliest Victorian style of furniture, which will afford an opportunity to all interested in this subject to judge of the great progress that has been made during Her Majesty's reign in the decoration and equipment of our homes.

At the Crystal Palace the present style of furniture will be treated in a broader manner, and here also design and arrangement will receive careful consideration. One of the

rooms, we understand, will be arranged by Mr. George Lock, late of Messrs. Collinson & Lock, of Oxford Street, and now established at 38 Conduit Street, Regent Street, where he is doing an extensive business.

With a view to further increasing the business, which is capable of considerable development, both with regard to furnishing and high-class decorations, a company has been registered under the style of G. Lock & Co., Limited, of which Mr. William Wallace, of the firm of William Wallace & Co., will be managing director.

### THE PATENT OFFICE.

THE fourteenth report of the Comptroller-General of Patents, Designs and Trade Marks for the year 1896 has been issued as a Parliamentary paper. It shows that the number of applications for patents, which in 1895 showed a decrease of 324 upon that of the previous year, increased in 1896 by 5,132, an increment four times as large as the average yearly increment. During the last two months of 1896 the applications came in at the unprecedented rate of 700 per week, the total for the year being 30,194. The increase of 1896, like the decrease of 1895, was mainly in provisional specifications, which showed an increase of 4,677, or 22·6 per cent., while the complete specifications accompanying applications showed an increase of only 452, or 10·4 per cent. The principal cause of the rise in patent applications is attributed to the development of the cycle industry, to which more than 5,000 of the inventions had reference. As regards the countries from which the applications were derived, there was a considerable increase in the number from Ireland, from all the Australian colonies except Queensland, from Canada, Natal and New Zealand, and also a certain increase in those coming from the principal foreign States. Of the total number of applications 691, or 2·3 per cent., were made by women, about 153 being for inventions connected with articles of dress. The number of applications for patents in this country received from inventors residing in other States of the Union, under the provisions of the International Convention of 1883, amounted to 247. The number of readers frequenting the Patent Office Library during the year was 113,397, or an increase of 5,112 as compared with the previous year. The new block of buildings facing Staple Inn was occupied by the staff in the early spring of 1896, and

the adjoining block is now in process of reconstruction. During the year 106 volumes of classified abridgments of patent specifications for the period 1884-88 were issued. Some 180,000 letters and forms and about 80,000 parcels of publications were despatched from the office during 1896. The copying of letters and other documents by type-writing machines amounted to about 7,000,000 words.

The number of designs applied for during the year amounted to 21,738, exclusive of 1,111 "sets" of designs, as against 20,507 single designs and 910 "sets" in the previous year. The term "set" includes any number of articles ordinarily on sale together, irrespective of the varieties of the size or arrangement in which the particular design may be shown on each separate article. During the year 1,269 applications for registration of designs were objected to by the Comptroller, and of these 524 were refused on account of their similarity to designs already registered, while the remainder were objected to chiefly on account of want of subject matter or of substantial novelty.

With regard to trade marks, the total number of applications for registration (including 133 applications to the Cutlers' Company of Sheffield) was 9,466, as compared with 8,272 in the previous year, while 3,243 trade marks were advertised and 2,917 were registered.

The total gross receipts from all sources in 1896 were 206,862*l.*, and the total gross expenditure was 96,354*l.*, showing a balance in favour of the Treasury of 110,508*l.* In 1895 the balance was 86,341*l.*, and in 1894, 85,763*l.* The amount of the gross expenditure in each of these years included expenditure on account of new offices and buildings.

### NEW IDEAS IN CERAMICS.

FEW things have been more interesting in recent years than the extended use of ceramic materials for architectural decoration and construction. The opportunities of introducing effects of colour in permanent pottery materials have been largely welcomed by architects, and yet not so much so as might have been expected or desired. Perhaps this may be due to the fact that it is not always easy to bring new ideas to the notice of those most likely to appreciate them. It is certainly difficult for anyone to realise the effect of a decorative scheme from the casual inspection of an isolated fragment of it.

## VOLUME LVI. OF THE ARCHITECT.

Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d. Office: 175 Strand, London, W.C.

It is with this thought in mind that Messrs. Doulton & Co. are now arranging in their showrooms at Lambeth a fairly complete display of what they have been producing recently in architectural materials and sanitary construction, and they hope to induce all those interested in the matter to make the journey to Lambeth—not a formidable affair, the showrooms being within two minutes' walk of Lambeth Palace. The works on view will make it evident that in decorative materials Messrs. Doulton & Co. are endeavouring to provide the widest possible range of colour and texture.

The coloured salt-glazed ware (in its earliest form as applied to pottery bearing the distinctive name of "Doulton ware"), with its strong colourings and indestructible glaze, has been used very successfully for tile-facings as well as for constructional block work. Several colours new to salt-glazed stoneware are now available as well as new methods of decoration.

A stoneware with semi-glazed (or eggshell) surface presents many valuable recommendations. It bears, so far, the name of "Carrara" enamelled stoneware, from the similarity of its texture to that of marble. The exterior of the new Birkbeck Bank now being erected in Southampton Buildings, Chancery Lane, from the designs of Mr. T. E. Knightley, is in this material. The absence of a high gloss and the quiet harmony of colour combine to render the effect very striking and suggestive to those who are in search of new materials.

A third class of material for exterior work is found in stoneware with a vitreous-enamelled surface. This ware has a more glossy surface than the "Carrara" stoneware, but is not so glossy as the salt-glazed Doulton ware. The colours applied are more or less opaque, different in this respect from the colours glazed by salt, which always present a somewhat varied transparent appearance brought about by the conditions of the firing. At the high temperature to which all stonewares are exposed in the kilns it is not possible to expect a very extensive palette of colours, but Messrs. Doulton & Co. have successfully enlarged this palette, and show some interesting suggestions in colour effects suitable for all kinds of exterior and interior decoration.

With the rather more extensive colour resources of faience glazes and enamels, Messrs. Doulton & Co. are able to gather together some effective specimens of what they have already supplied for various buildings, and of further new arrangements in colour and design. The body used for the glazed terra-cotta is very hard and is not open to the objections hitherto urged against a soft ware. All kinds of effects are

available in faience modelling in high or low relief, ornament in raised outlines, "underglaze" hand-painted designs of figures, flowers, landscapes, &c., painting in "impasto," painting in glazes or in dull-surfaced enamels, or in Indian and Persian styles. One of the most recent decorative works executed is in ivory-enamelled faience enriched with gold.

It is hardly necessary to do more than mention that in terra-cotta Messrs. Doulton & Co. have recently been entrusted with some large works in which their brown-buff terra-cotta has been successfully introduced.

The showroom for glazed ware mantelpieces and fireplaces has been rearranged, and now contains several new patterns worthy of attention. It is almost too late in the day now to point out the advantages and attractiveness of a glazed ware of good colour for use in what is generally the most conspicuous feature of a room. With these fireplaces is shown one of the open stoves with back and front fires and air-flues which are now being used for hospitals and asylums, the whole construction being in glazed ware.

An altogether new showroom has been added to enable the firm to exhibit some of their more recent introductions in sanitary wares and fittings. Among these may be mentioned:—

*The Silent Arrangement for Cisterns.*—All syphons have hitherto made more or less noise in action at the end of the flush; in private houses especially this has been considered a drawback, but by the arrangement of Messrs. Doulton & Co.'s present tank, silent action has been obtained without the power of the flush being in any way weakened.

*Simplificatus Valve Closet.*—This is a new form of closet, being a combination of the pedestal and valve principle, and combines all the advantages of both closets. The basin and trap being entirely of ware, a large body of water is retained in the basin, and owing to the depth of water in the trap, even should the valve be left open, the pan itself can never be dry, the flushing being done by a simple waste preventer.

*1896 Patent Bath.*—This is an arrangement for quick waste to bath, and instead of the old-fashioned standing waste being encased and almost impossible to get at for cleansing, it is in this case exposed, being fitted in a recess at the end of bath. It is glass enamelled inside in order to, as far as possible, prevent fouling, and can be easily removed and cleansed.

*Vitreous and White Porcelain Enamels as Applied to Iron Baths.*—By means of these all the advantages of an earthenware bath may be obtained at a considerably lower cost. The vitreous enamel can be supplied at the same price as the

ordinary first-class metallic enamel, and can be had in either French grey or light green colours.

*Glass Enamelled Iron Pipes.*—The adoption of this improvement gives a very smooth surface to the interior of the pipe.

*Waverley Basin.*—This is a large recessed lavatory basin with removable standing waste and quick discharge.

*No. 515 Sink* is very suitable for hospital or private use. It is handsome in appearance, and all parts are exposed, so that no obnoxious matter can remain unseen, as is often the case when an enclosure is used. A grating and chamber cleanser can be used in connection with this sink. The basin is thoroughly flushed by a syphon cistern.

Architects would find it well worth while to pay a visit of inspection to these interesting showrooms.

### THE BRUSSELS EXHIBITION.

NOTWITHSTANDING the oft-repeated assertion that World's Fairs are "played out," the exhibition about to open at Brussels bids fair to prove, says the Brussels correspondent of the *Times*, a draw in the most comprehensive sense of the word. Nothing could have been better conceived as a device for attracting all sorts and conditions of men than this latest expression of the industrial, artistic, scientific and land-appropriating energies of the human race towards the close of the nineteenth century, planned and put into shape by so art-loving a people as the Belgians. The natural conditions attending the enterprise are also peculiarly favourable. The granite of the country is admirably adapted to the construction of the monumental portico which ushers the visitor into the vast hall, 1,200 feet in length, constituting the main building, and crowned by a dome of majestic proportions.

From this central edifice accessory halls stretch away to the right and left to a distance of 220 metres. The whole block embraces an area of a million superficial feet, and is framed by a landscape which nature and art have alike contributed to beautify.

In conjunction with the erection of the exhibition buildings a nobly devised avenue is in course of construction, which serves as a setting for the whole, and further connects the Parc du Cinquantenaire, or site of the main building standing in Brussels, with the historic park of Terveuren, a village five miles away, whose origin tradition relegates to the days of

St. Hubert, that mighty hunter before the Lord, who, according to the old chroniclers, "prenait tout son plaisir en chasseries," and who early in the eighth century was converted to Christianity while out hunting by a white stag, which appeared before him carrying "la très sainte croix" between its horns. Under the Dutch Government Terveuren became a royal residence of the Prince of Orange. In later years it was the retreat of the widowed and reason-bereft Empress Charlotte of Mexico, sister of King Leopold of Belgium. For exhibition purposes it has finally blossomed into a Congolese village, if the term may be allowed in connection with the inroad of some 250 unsavoury specimens of the inhabitants of Darkest Africa. There is, however, a certain artistic compensation in noting the uses to which certain products of the Congo State have been turned in Belgium, as an example of which the beautiful ivory Christ hanging upon a cross of native wood, executed by the sculptor Meunier, deserves special mention.

The Avenue de Terveuren has been designed with a lavish regard to the various means of locomotion to which two-legged beings may have recourse. Trees are planted on either side, and the avenue itself is divided longitudinally into five sections, along which one may respectively walk, ride, drive, cycle, or fly through space in an electric tramcar, as the spirit moves one. But each section is sacred to its own particular style of locomotion, and heavy penalties would attach to the error of employing the "voie carrossable" as a "voie cyclable," or *vice versa*. As regards the metaphor of flying through space, there is an exhibit of Baron de Beeckman's which promises to justify it by conveying the traveller for a certain distance at a rate corresponding to the thrilling speed of 130 miles an hour. A peculiarly attractive feature of the exhibition is the reproduction, under the name of Bruxelles-Kermesse, of a conglomeration of quaint old-fashioned shops and dwellings modelled upon the buildings which still existed in the first half of the century, when picturesque façades, small green window-panes, low doorways, and casual angles and corners gave the charm of unexpectedness to the architecture of the day.

Here we see again the fantastic badges with the still more fantastic Flemish legends environing them, that gave such individuality to each separate shop and drinking booth, while to render the illusion still more complete the residents and promenaders are attired in the costumes of 1830.

There is a certain piquancy in the proximity to Old Brussels of the great green lawn where the old-world jousts and sports which justify the name of Bruxelles-Kermesse will be carried on,

## THE "SUNLIGHT" INCANDESCENT GAS BURNER.

THE NEW INCANDESCENT (Sunlight Patent) GAS LIGHTING COMPANY, LIMITED,  
33 & 34 SHOE LANE, LONDON, E.C.

for we here encounter a gigantic wheel, containing 3,000 lamps in perpetual and scintillating revolution, which without doubt would have considerably astonished our ancestors.

As regards this revival of an ancient part of the town, it must not be forgotten that in the real every-day Brussels, in the lower part of the city, the visitor may see a living and lasting presentment of the architecture of the fifteenth and sixteenth centuries that nothing can surpass, in the beautiful Grande Place, with its world-renowned Gothic Hôtel de Ville and Maison de Roi, hovering between the Gothic and the Renaissance, and its ornate houses of the guilds, with their symbolical and decorative façades.

The entrance to Bruxelles-Kermesse takes the form of a faithful reconstitution of the celebrated triumphal arch, designed by Rubens in honour of the arrival of the Archduke Albert and his wife Isabelle, while the houses follow the lines of those which composed the old quarter of the town known as the Marché au Beurre. Some sixty or seventy of these are utilised as cafés, restaurants, brasseries and establishments for the sale of what the Germans call "Galanterie Waren." Others are reserved for the exercise of industries and crafts peculiar to Brussels, such as lace making, carpet weaving, &c.

A word in conclusion about the organisation of the Brussels Exhibition, which poses as a worthy precursor of the mighty Paris show that is to inaugurate the next century. Its direct patrons are the King and the royal family, and it has the financial aid of the Government, the city of Brussels, and the province of Brabant. The affair, in American parlance, is really run, however, by a great financial society, to whom the profits, if any, will accrue. These are said to be pledged in advance to a national or philanthropic undertaking.

Great satisfaction has been expressed at the number of adhesions notified from other countries. France was first in the field, closely followed by Germany and Great Britain. It is known that Sir Albert Rollit is president of the English Commission. The organisation and executive committees emanate from the administrative commission of the aforementioned financial society, but high influences quite independent of the latter have also been enlisted. For instance, the General Commissioner for the Government is the Comte d'Oultremont, who has represented Belgium at the exhibitions of Philadelphia, Paris, Antwerp, and others. For the foreign section M. Pecher, honorary Consul-general of Belgium, has been appointed president, while the commissary for the jury and the recompense to be awarded is M. Gody, who is also

director of the Société Anonyme, Bruxelles-Exposition. Among Eastern countries, Russia, Persia and China will be well represented. A considerable influx of visitors, among whom the French predominate largely, is already announced.

### THAMES CONSERVANCY.

THE report of the Thames Conservators for the year 1896 has appeared. The Commissioners refer to the completion of the inquiry instituted by Commissioners appointed under the Thames Conservancy Act, 1894, and express concurrence in the opinion of the Commissioners as to the desirability of deepening the river both above and below Gravesend. The Conservators have decided that this work shall be carried out and have entered into a contract for dredging from the Nore to Gravesend a channel 1,000 feet wide and 26 feet deep at low water of spring tides. They have further resolved to dredge channels of the following dimensions above Gravesend:—From Gravesend to Crayford Ness, 1,000 feet wide and 24 feet deep; from Crayford Ness to the Albert Docks, 500 feet wide and 22 feet deep; and from the Albert Docks to the Millwall Docks, 300 feet wide and 18 feet deep. The Conservators have also adopted the recommendation of the Commissioners to discontinue the deposit of dredged material in the river at Deadman's Hole, and have obtained the sanction of the Board of Trade to the discharge of the material at sea in the Barrow Deep. In order that the survey recently completed may be kept up to date, the Conservators intend to appoint two surveyors to sound and chart the river from the Nore upwards, and to establish a self-registering tide gauge at Southend. Thus in future an official record of the condition of the navigable channels of the Thames will always be available, and the information will be of great value to the shipping interests of the port. During the past year 45 sunken vessels were raised by the Conservators' plant—six being steam vessels, measuring 11,327 tons, and 39 sailing vessels and barges, measuring 1,608 tons. The dredging plant was employed in the further improvement of the navigable channel.

The report next describes the various works in progress in the Upper River, and states that the estimates of the Conservators' receipts and expenditure for the river above Staines for 1897 show that, for the first time for many years, there is likely to be a substantial balance of receipts over ordinary expenditure. This balance the Conservators propose to expend

in additional dredging in parts of the river which are so shallow as to prejudice navigation, and at the same time to prevent the free escape of flood water.

The Conservators have continued to carry into effect the powers conferred upon them by their Act of 1894 to prevent the pollution of the Thames and its tributaries in the largely extended area within which those powers are exercisable—an area covering more than 3,800 square miles—and in doing so have endeavoured to secure the important public object of the purification of the waters of the Thames without putting too great a pressure upon the authorities concerned. Special attention has been given to the more serious cases of pollution from towns and other populous places in the Thames watershed. These places are under close supervision, and samples of the drainage are regularly examined by the analyst to the Conservators. The authorities of several important towns in the watershed, including Newbury, Guildford, Godalming, Caversham and Staines, have completed and brought into operation new sewerage systems by which the pollution of the river and its tributaries from those places should be prevented. Among other places where the requirements of the Conservators are being complied with, mention is made of Sunbury, Swindon, Maidenhead, Uxbridge, St. Albans, Berkhamsted and Willesden, where the local authorities are effecting extensive improvements in the existing drainage arrangements; while at Faringdon, Wantage, Hungerford, Witney, Thame, Aylesbury, Amersham, Marlborough, Aldershot (town and camps) and Woking the authorities have similar schemes before them, some being under the consideration of the Local Government Board. The Conservators have in some instances encountered difficulties in enforcing the provisions of the Act, and have instituted legal proceedings against the responsible parties. In three cases convictions have ensued, and in several other cases the Conservators have consented to an adjournment on receiving from the bodies or persons summoned an undertaking to prevent the continuance of pollution. As the result of protracted action by the Conservators, they have succeeded in securing the adoption by the Corporation of Wokingham of measures by which it is hoped the pollution of the Loddon from that town will be arrested. The villages and other small places in the Thames basin have been inspected, and in many instances pollution has been diverted, while the subject of drainage at many places is receiving the consideration of the rural councils. The inspection of farms, manufactories, private

residences and other scattered premises has been continued, and in 446 cases pollution has been diverted. The houseboats and launches on the river have been watched by the inspectors, and no case of pollution from such vessels has been detected. The Conservators have maintained the flow of the river, and offensive matters have, in compliance with the Act, been removed from the river and its tributaries.

## PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

### APPLICATIONS FOR PATENTS.

- 6060. Archibald Griffin Rider and Edwin Russel, for "Improvements in, and relating to, sliding sash windows."
- 6066. The Wilkinson Sword Company, Limited, for "An improvement in door locks."
- 6113. Frederick Charles Lynde, for "Improvements in flushing cisterns and the like."
- 6129. Thomas Bainbridge, for "Ladder grip and scaffold rest."
- 6138. James Hart Skinner, for "Improvements in, or relating to, chimney ventilating and like cowls."
- 6143. John Arthur Smith, for "Self-locking window sash fastener."
- 6191. John Abraham Noel, for "Improvements connected with chimney or ventilator tops."
- 6224. Edward Taylor, for "Improvements in sash fasteners."
- 6242. John Henry Vidal, for "Improvements in the flushing of water-closets."
- 6310. William Gardiner, for "An improved window fastener."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 73 Chancery Lane, London, W.C.

# THE NEW EXPANDED METAL

Meshes from  $\frac{3}{16}$  in. to 6 in. wide. Strands from 24 B.W.G. to  $\frac{3}{16}$  in. thickness of steel.

**FOR BUILDING CONSTRUCTION**, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

**FOR SOLID PLASTER PARTITIONS**, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

**FOR FIREPROOF LATHING**, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

**FOR CONCRETE FLOORS WITH EXPANDED METAL**.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

**FOR EXTERIOR WALLS OF BUILDINGS**.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

**FOR FENCING, TREE GUARDS, WINDOW GUARDS**, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

**OTHER USES FOR EXPANDED METAL**.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

**BRASS, ALUMINIUM**, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

**CATALOGUES AND PRICE LISTS** can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

## SCOTLAND.

For building an ironstone kiln at Loanhead.

J. MCLEOD & SONS, Dalkeith (accepted).

UNEQUALLED FOR ALL DECORATIVE PURPOSES.

# Aspinall's

## ENAMEL

For Inside and Outside Work.

**READY FOR USE.**

This Enamel, which has taken the Highest Award wherever exhibited, imparts a rich glossy appearance to all surfaces to which it is applied, and dries with a hard impervious surface as washable as porcelain. It is admirably adapted for use in Hospitals, Public Institutions, Mansions, Private Houses, &c., where sanitary conditions are of the first importance. One gallon will cover about seventy square yards on a non-porous surface, and is equal to about three gallons of mixed paint.

**ASPINALL'S ENAMEL** can be made to any tint, is absolutely non-poisonous, and is unequalled for *all* decorative purposes.

Builders and Decorators should apply for full particulars of our special "DECORATOR'S" ENAMEL.

**ASPINALL'S ENAMEL, LTD., NEW CROSS, LONDON, S.E.**

## WESTMINSTER.

For construction of new doctor's room, and for the asphalt paving, &c., of the men's workshop. Messrs. JOHN WALDRAM & SON, surveyors, 17 Buckingham Street, Charing Cross, W.C.

## Accepted tenders.

Johnson & Manners, Great Pulteney Street, new doctor's room	£62	10	0
Hobman & Co., South Bermondsey, asphaltting	40	15	4

A DESTRUCTIVE fire occurred in the timber works of Messrs. Anderson & Henderson, Kinning Park, Glasgow, on the 26th inst. The works cover an area of over three acres, including sawmill, joinery and timber stores, and the whole place was swept by the flames, only the office being saved from destruction. The damage is roughly estimated at from 40,000*l.* to 50,000*l.*

## TRADE NOTES.

THE new dormitories, Rainhill Asylum, near Liverpool, are being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke flues, by Messrs. E. H. Shorland & Brother, of Manchester.

THE east end of Penybont Church, Radnorshire, has been enriched with a stained-glass window, in the centre light of which is depicted "The Crucifixion," and in the two sides "The Light of the World" and "The Good Shepherd" respectively, with corresponding emblems in the tracery. The work is from the studio of Messrs. Jones & Willis, of Birmingham and London.

MR. EDWARD STANFORD, of Charing Cross, is issuing a new and very useful pocket-map of London. Its scale is 4 inches to a mile, and it extends from Kentish Town on the north to Clapham Common on the south, and Bethnal Green on the east to Kensal Green on the west. It shows main roads, omnibus and tramway routes, parks, open spaces, public buildings, hospitals, hotels and theatres with the greatest accuracy and detail.

## NEW CATALOGUES.

MESSRS. HAYWARD-TYLER & Co., of 90 and 92 Whitecross Street, E.C., are issuing their new list (B) of asbestos-packed and other steam fittings and engineers' sundries. The book consists of nearly 150 pages of well-printed descriptive matter relating to wheel valves for all purposes, steam cocks, blow-off valves and cocks, fusible plugs for boilers, expansion joints, lubricators, injectors, steam pumps, lifting jacks, &c., &c., all of which are illustrated by carefully executed drawings. Prices are also given and the book will be found very handy for the purpose of reference.

MESSRS. STRODE & Co. have sent us a large book of designs for electrical illuminations for the Diamond Jubilee. These designs, which are in white on a blue ground, offer a wide field for choice, ranging from a scheme for the effective illumination of the entire façade of a house down to the more or less elaborate arrangement of the royal initials.

ALDERMAN ROBERT SWAN, J.P., the well-known builder and contractor of Sunderland, died suddenly on the 22nd inst. at his residence in Roker Avenue, Monkwearmouth.

CAIN AND HIS FAMILY.

CATHEDRAL SERIES.—SALISBURY: NORTH CORNER OF WEST FRONT.

THE CHURCH PORCH, CLEY-NEXT-THE-SEA.

ENTRANCE HALL, FOR MESSRS. FOSTER &amp; COOPER.

## VARIETIES.

A LARGE piece of stonework, weighing nearly a ton, fell from the top of the Leicestershire Bank, Kettering, on to the footpath. Two pedestrians had most miraculous escapes.

WITH a view to meeting the increasing demands on the capacity of the Dundee Royal Lunatic Asylum, an extension of the buildings in the way of providing two new dormitories is just now being completed.

NEW Sunday-schools at the rear of Queen's Road Wesleyan chapel, Beverley Road, Hull, have just been opened. The schools have been erected at a cost of 3,500*l.*, and will accommodate about 700 scholars.

A NEW drill hall for the K Company of the 2nd V.B. Lancashire Fusiliers has just been opened at Ramsbottom. The hall, which is of capacious dimensions, has been erected at a cost of over 2,000*l.*

THE watching, lighting and fires committee of Aberdeen Town Council have adopted the plans of Mr. Mackinnon, architect, for the new fire brigade station in King Street. The building is estimated to cost 10,400*l.*

THE Duke of Cambridge, accompanied by General Bateson, visited Worthing on Monday for the purpose of inaugurating the new waterworks, which, together with other local improvements, have been constructed by the Corporation at a total cost of over 100,000*l.*

WHILE helping to fix a heavy Portland stone cornice on the top of the new buildings known as Albert Hall Court, W., a builder's labourer, named John Alexander, fell to the ground, a distance of 80 feet, through the stonework on which he was standing giving way. Death was instantaneous.

THE name of "Ceramic Stone" has been given by M. Garchey, a French inventor, to a new building stone obtained by him from broken glass. The glass—broken bottles, window-panes, &c.—is reduced to powder, different kinds are mixed if a variegated colour is desired, and the pulverised material is devitrified by passing successively through two furnaces, the second one being of high temperature. The pasty mass is then passed under a press, which gives it shape and consistence.

A SHOCKING accident happened at Burnley on Tuesday afternoon to a Carlisle steeplejack named Greenville, who was repairing the chimney at Mr. Robert Brown's joinery works, Talbot Street. About five o'clock he was fastening his appliances and trapèze on to the chimney about 10 yards from the top when one of the staples gave way, and he fell a distance of 35 yards. He alighted on his feet on some solid brick, and the concussion crushed them to a pulp. The man succumbed to his injuries.

A HOSPITAL for the treatment of infectious diseases has been erected at Millerton Hill, near Ayton, by the East District committee of Berwickshire County Council, and was publicly opened on the 21st inst. The hospital, which is of iron and wood, was erected by Messrs. Spiers & Co., engineers, &c., Glasgow. The main block consists of two wards to accommodate twelve patients in all, but only ten beds are provided meantime. The buildings are situated in a dry, open and airy position, and are fully equipped with the latest sanitary and other hospital appliances, and an abundant supply of excellent spring water. The total cost of the hospital and its outfit has been about 1,000*l.*

THE British South Africa Company's new hospital at Gwelo will be opened early in June. The building is nearly finished and will be in habitable condition by the time the three Nursing Sisters, who leave England on May 1, arrive at Gwelo to take up their hospital duties among the Europeans and native miners in the district. The Buluwayo Hospital, built in memory of the victims of the Matabele campaign, has raised the standard of hospital construction in Mashonaland, for it is an extremely comfortable and handsome building. Until this hospital was put up the sick of Buluwayo were treated in thatched, unburnt-brick huts, while Kaffir patients were nursed and Sisters accommodated in native huts.

A HANDSOME triptych has been erected over the altar of St. Alban's Church, Holborn. Its central portion, which, in

# EWART'S COPPER "CROWN" VENTILATOR

FACTORY—346, 348, 350 EUSTON RD.,  
LONDON, N.W.

carved alabaster gorgeously coloured and gilded, represents in a series of five panels the martyrdom of St. Alban and attendant circumstances as well as the translation of his relics to the great Abbey, is a huge rectangle, whose chief feature is a resplendent image of the protomartyr of England. The panels aforesaid are set in a massive frame of oak, crowned by a laudatory inscription in honour of St. Alban and a cresting of exceedingly elegant pierced flower-work. A majestic figure of the Saviour, flanked by others representing SS. Mary and Gabriel, crowns the work, which has been designed by Messrs. Bodley & Garner, to whom St. Paul's Cathedral owes its fine reredos.

THE new school erected by the Glasgow School Board for the benefit of Garngad Hill district was formally opened on the 23rd inst. The school, which is named Rosemount Public School, is erected on a site facing Millburn Street, at the highest point of Garngad Hill. The main feature of the interior is the central hall, 70 feet by 26 feet, which is carried up the full height of the building. The staircase, cloakrooms and lavatories are placed on either side of the eastern end of the hall, from which they are separated by glazed screens. An additional drill-hall, 68 by 26 feet, is also provided on the lower floor. Both halls are laid with wood-block flooring. The school and classrooms—sixteen in number—are grouped round the central hall on two floors, and are fully equipped. The number of scholars provided for is 1,203. The total cost is expected to be within 13,000*l.*, exclusive of cost of site. The architect of the school was Mr. John B. Wilson, and Mr. D. Johnstone acted as clerk of works.

### BUILDING AND BUILDERS.

MR. CHARLES WYNDHAM has requisitioned the services of Mr. Sprague for the new theatre which he proposes to build in St. Martin's Court, Charing Cross Road, and the plans have been approved by the London County Council and the local vestry.

THE corner-stones were laid on the 24th inst. of new premises which are in course of erection for the North Ward Liberal Club, Ossett.

THE foundation-stone of a House of Mercy for the training of young women and girls in domestic service was laid in the convent grounds at Lawside, Dundee, on the 21st inst. The building will be a large one, two storeys in height, and in it the latest laundry and washing apparatus will be introduced.

### HORNIMAN'S FREE MUSEUM.

THE Horniman Free Museum, which was dedicated to the free use of the public in 1890, occupies a commanding position in London Road, Forest Hill, and contains curiosities collected by Mr. Frederick John Horniman, M.P., during the past forty years from all parts of the world. The exhibits include Cyprian and other pottery, treasures from the Holy Land, mummies from the tombs of Egypt, Oriental manufactures and artistic productions, and natural history and zoological curiosities. Two years ago a park and a recreation ground at the rear of the museum were thrown open to the public, and Mr. Horniman has presented an additional eight acres to the neighbourhood. The opening ceremony took place on the upper lawn, known as Surrey Mount, from which an extensive view of the surrounding country can be obtained. In the course of his address to a large crowd of visitors, Mr. Horniman emphasised the advantages of open spaces to the public, and expressed the pleasure it gave him to know that the inhabitants of that neighbourhood had derived much benefit from the free use of the museum and grounds. The exhibits, he added, were contained in premises once used as a dwelling-house, but in celebration of the sixtieth year of Her Majesty's reign he proposed to erect a new museum which would be of lasting benefit to the inhabitants of South London. Mrs. Horniman then declared the grounds and pleasure gardens open. The present museum contains twenty-four saloons of exhibits. The proposed new building is to be much more commodious.

### THE ROYAL CALEDONIAN ASYLUM.

A SPECIAL court of the guardians of the Royal Caledonian Asylum was held in the board-room of the Royal Scottish Corporation, Crane Court, Fleet Street, on Monday. General Moncrieff presided. It was unanimously resolved, on the motion of Mr. John Scott-Balfour, seconded by Mr. Donald Swanson, that authority be given to the managing directors to take such proceedings as they might think necessary for disposing of the present site and building in the Caledonian Road, Holloway, and for erecting a new and more commodious building in a northern suburb of the Metropolis. Towards this object it was announced the treasurer, Sir John R. Heron-Maxwell, had received the sum of 12,000*l.* from an anonymous

donor as a gift in commemoration of the Queen's jubilee and in memoriam of the late Duke of Albany, who took a very great interest in the prosperity of the institution and presided at one of its anniversary festival dinners, with gratifying results to the funds. It was considered that the situation of the present building, which was erected in 1828, is, from its proximity to Pentonville Prison and from other causes no longer suitable or desirable.

### PROPOSED WESTMINSTER IMPROVEMENT.

A PETITION has been deposited at the House of Commons for leave to bring in a Bill during the present session authorising the extension of the Victoria Embankment as far as Lambeth Bridge, and various extensive improvements in the parishes of St. Margaret and St. John, Westminster. The proposed improvements will involve the clearance of an area 27 acres in extent, and the cost of the acquisition and clearance of the site is estimated at upwards of 1,000,000/ sterling. The proposals include the formation of a wide approach or avenue from Horseferry Road to the Victoria Tower, forming a connection with the approaches to the new Lambeth Bridge; the widening of a street so as to make a connection between Great Smith Street and Horseferry Road, and a street opening out the church of St. John, Westminster; the formation of a square of the size of Hanover Square in front of the Church House buildings, Great Smith Street; and the removal of the whole of the insanitary area and slums of Westminster, and the construction upon the site of large buildings more or less of a public character.

### MODEL VILLAGE OF BOURNVILLE.

A LITTLE beyond the great cocoa manufactory of Messrs. Cadbury Brothers, and on the opposite side of the thoroughfare, says the *Birmingham Post*, stands Bournville Hall, with its velvety lawn sloping to the road, and commanding from its windows a stretch of undulating country which is terminated by the high ridge of Selly Oak. A lovely outlook it must have been when the mansion was erected and when nothing save grassy slopes and clusters of noble trees met the eyes, turn which way they would; but at present all is changed, and idyllic quietude has given way to ceaseless activity. In the im-

mediate foreground men are busily engaged in constructing a large recreation ground for the use and pleasure of the male employés of the great factory which stands hard by, whilst beyond the work of cutting streets is busily in progress. The uninformed pedestrian, were he a lover of nature, would sigh and picture to himself rows upon rows of houses, erected with the sole idea of packing as many as possible on the smallest space of ground, without thought or care for the comfort and health of the occupants—in fact, an outlook of bare walls, roofs and chimney-pots. The picture thus conjured up would, however, be erroneous, for it is upon this estate that Mr. George Cadbury's model village of Bournville is springing up—a village which has no exact prototype in the United Kingdom, or indeed elsewhere; but which, it is hoped by the founder, may not long stand solitary. Mr. George Cadbury has cherished the scheme from boyhood, and it is to be hoped that he will not only see it completed, but imitated in many parts of the country.

In the limits of our space it is impossible to do more than briefly indicate the chief features of the scheme. The land acquired for the purpose of the village consists of about 140 acres, and is situated at the rear and also to the left-hand side of the works. It is bounded on the right by the Midland Railway, on the left by the Row Heath Road and Oak Tree Lane, and extends from the Mary Vale Road, which is situated behind Bournbrook Hall, to Selly Oak, where it adjoins the property of the King's Norton Guardians. The hall and its surrounding grounds are not part and parcel of the estate, however, but belong to the firm of Cadbury Brothers, who have retained them—the hall as a home for their female employés, and the grounds for the purpose of recreation. It is proposed to erect six houses to the acre on the building estate, or about 700 in all, for certain plots of land have been set apart for general recreation grounds for the tenants. Thus the richly-wooded dell known in the neighbourhood as Stock's Wood will remain untouched by the hands of the builder, and a rectangular piece of land, seven acres in extent, which faces the road to Northfield, and is situate opposite the junction of the Row Heath Road and Oak Tree Lane, has also been appropriated as a park for the tenants of the estate. It should form an ideal recreation ground, for it is well wooded and the rich turf slopes down on either side to the banks of a stream. Then, in addition, there will be a number of playing-grounds set apart for the children, which will prevent them getting into mischief in the gardens or meeting with injury in the streets. At every turn, in fact, one meets with something that has been done to

insure the comfort, health and happiness of this fortunate community. Houses may come and go, but for 999 years their number on the estate must remain the same, for that is the term of the lease granted to each tenant, who is bound by his agreement to observe the conditions of the scheme. It was impossible, of course, to make the estate freehold, inasmuch as tenants would have then possessed the power of using their ground as they liked, and could have defeated Mr. Cadbury's prime object, which, as set forth in the prospectus, is "to make it easy for working men to own houses with large gardens, secure from the danger of being spoiled either by the building of factories or by interference with the enjoyment of sun, light and air." The ground rent varies, according to the situation of the plot, between  $\frac{1}{2}d.$  and  $1d.$  per yard. No houses below a certain standard are allowed to be erected, and only a certain amount of building is permitted on each plot of ground, so that there is no danger of the gardens being overshadowed and spoiled, or the neighbourhood losing its pleasant rural aspect. Thus the fullest encouragement is held out to the thrifty and industrious artisan—the scheme is not limited, as many thought, to the employés of the firm, but, of course, they have the preference, other things being equal—to become a member of this novel village. Should a tenant not be able to pay outright for the building of his residence Mr. Cadbury's solicitors will advance the money at the rate of  $2\frac{1}{2}$  per cent. to 3 per cent. interest—at  $2\frac{1}{2}$  per cent. if the tenant can find half the requisite sum or 3 per cent. if he can only pay down a smaller proportion of the money. In the latter case Mr. Cadbury will erect the house and take a preparatory agreement for lease and mortgage. The money lent will be repaid yearly, together with the interest, and in twelve years the house becomes the property of the tenant, who is not so much money out of pocket as if he had occupied an equally good house and paid a weekly rent to a landlord. It is estimated that the produce of the garden will more than cover the small ground-rent, and certainly there is no reason why it should not if well looked after by the tenant, for many of the gardens are 40 yards or more in length, as the building plots vary from 60 to 85 yards long, in addition to being about 10 yards in width. On a portion of the estate which lies between the Bournville Lane and Mary Vale Road, to the left of Bournville Hall, about seventy of the houses have already been erected, and a glimpse at them gives proof of the excellence of the scheme. They are well built, and are for the most part semi-detached, although

they can be erected in fours, which is the greatest number that can be possessed by the same owner. The gardens insure a fine open space between the backs of the buildings, and in time almost perfect privacy will be established, for Mr. Cadbury has caused to be planted on either side of the dividing hedges three rows of fruit trees—a happy and economic idea. The trees will provide fruit for the tenants, will be agreeable to look at, and will prevent the backs of the houses being overlooked. This idea will be carried out all over the estate, and when it is considered that trees have also been planted in every convenient place it is easy to see that the suburban character of Bournville will be maintained. It will be interesting to read the report of the medical officer of health for the village fifty years hence. It should boast a phenomenally low death-rate. For the houses already built a playground for the children, half an acre in extent, has been set apart. A large wooden shed, ornamental in design, has been set up, so that in case of a shower the children can still enjoy the fresh air without getting wet. Adjoining the playground is a lodge containing baths for the use of those tenants whose houses are not furnished with a bath-room. Bournville will be able to rival Edgbaston in everything excepting the size of its houses, and its tenants will possess the additional advantage of having a park of seven acres and a beautiful wood of between three and four acres devoted to their own use.

Though not forming part of the building scheme, the recreation grounds, which have been provided by Messrs. Cadbury Brothers, deserve a few words of description. They have been acquired solely for the use of the employés of the firm, but, inasmuch as many of the latter will doubtless be tenants on the estate, the two things are to some extent associated. The grounds in the immediate vicinity of the hall, now used as a home for sixty of the girls employed in the works, have been set apart for the benefit of the female employés. They cover about 12 acres, and half will be used as a playground, whilst the other half will be reserved for those who prefer to take a book and spend a quiet hour. It is an ideal spot for rest, the silence being unbroken save for the cawing of the rooks nesting overhead in the elms. A large wooden structure has been erected in the recreation ground, and here in wet weather the girls can indulge in health-giving exercises and at the same time enjoy the freshness of the breezes that blow from the Lickey Hills and the surrounding country. The men's recreation-ground is on the opposite side of the road, and is, almost immediately in front of the windows of the hall.

445 OXFORD STREET, LONDON, W.

Ten acres have been given by Messrs. Cadbury for the construction of a cricket ground and cycling and running track. There was a slope of about 30 feet between the road and the brook at the bottom of the valley, and consequently a great deal of labour has been required in levelling the ground, but the work is rapidly progressing, and it is hoped that it will be completed at an early date. The cricket ground has been constructed under the supervision of G. G. Hearne, the Kent cricketer, and an excellent playing pitch should be secured. It is not improbable that a county match will be played there during the ensuing season. The cricket ground will be surrounded by a cycle track of three laps to the mile, and there will be ample accommodation for the spectators on the tiers of seats that will be erected on the bank which has been formed by the cutting away of half the slope in order to secure a dead level. The cost of construction will be about 2,500*l*. At the bottom of the recreation ground the firm have constructed a handsome open-air bath for the use of their workmen. It is intended by Messrs. Cadbury that the recreation grounds shall be preserved as open spaces for ever, and there is a clause in the deed of gift to the effect that they are handed over to the firm, whose property they will be so long as they are used for the specified purpose. Should they be used at any time, however, for any other purpose they at once become the property of the city or the county authorities, whichever body may then have charge of the district of Bournville. Copies of the deed will be duly forwarded to the clerks of those bodies. Thus, whatever may happen in surrounding districts, there will be at least one suburb of Birmingham which will preserve its character for many generations. It may be mentioned that Mr. A. P. Walker, of Bournville, acts as estate agent and surveyor in the carrying out of the scheme.

#### THE ROYAL INFIRMARY, GLASGOW.

THE proposal to rebuild Glasgow Infirmary has not obtained general approbation. A meeting of the medical profession of Glasgow and the West of Scotland has been held for the purpose of considering the subject, when difference of opinion was apparent. Professor W. T. Gairdner presided.

Dr. Macgregor Robertson intimated that he had received seventy-five letters of apology for absence. Professor Dunlop, in his letter said:—"I hold very strongly the opinion that if anything of a really valuable and permanent kind is to be done

to the Royal Infirmary a new and healthier site should be obtained on which to erect a modern hospital, converting the site of the existing medical and surgical wards into an open public space, thus increasing the size and enhancing the beauty of the Infirmary Square. I do not sympathise with the views which have been expressed as to the healthiness of the site or the general salubrity of the wards; very long experience and observation have led me to an entirely opposite conclusion. As a student, a resident house surgeon, a dispensary surgeon, and ultimately as a full surgeon, I have had an experience of the Royal Infirmary extending over a period of thirty-four years, beginning with the year 1858. I saw the removal of the old wooden sheds in which the cholera patients were treated, and the foundation prepared for the surgical house, the site being on the edge of a huge cholera pit. The whole ground behind the hospital up to near the buildings of St. Mungo's College was used as a grave for cholera patients during the epidemic of 1849. In the early days of Mr. Lister these wards were very unhealthy, and although their condition was greatly improved by the rigid adoption of cleanliness and the new practice invented by him, aided not a little by an attempt which was made by the directors to destroy by quicklime the putrefying remains of the cholera dead, yet when wet and fogs prevailed hospital gangrene, pyemia, erysipelas and other forms of blood poisoning frequently attacked the patients, and rapidly proved fatal. In one week of close, muggy wet weather I have seen five patients in these wards dying from pyemia, due to emanations from the cholera pits. A muggy day was always a source of concern and anxiety to me in these years, and muggy days were painfully common. . . . With an earnest yearning for the continued prosperity of the Royal Infirmary, wherein I had worked so many years of my life, I have longed for the time when I might witness it rebuilt on a healthy site, and its wards and equipment brought up to the level of modern requirements in medical science. To help in bringing about this happy result I shall gladly contribute."

The Chairman said that personally he should have had great difficulty in taking the chair at the meeting had it been supposed for a single moment that it could be construed as a movement in hostility to the Royal Infirmary. They were not opposed to the Royal Infirmary or Lord Provost Richmond's scheme for drawing out public liberality towards a great public object. They did not want to intercept it; they only wished that proper consideration should be given to its application.

REPRODUCTIONS OF

**The FINEST EXAMPLES.**

Only the previous day he had the pleasure of meeting Lord Provost Richmond. They talked over the subject, and his lordship told him that he did not consider that the resolutions that were to be submitted to the members were at all strong or offensive. He said he could almost accept them; at all events that his mind was perfectly open, and that he was desirous of having the best possible advice of every kind or any communication that could tend to the thing being done in the best way.

Dr. Henry E. Clark moved:—"That this meeting of the medical profession of Glasgow and the West of Scotland is in full sympathy with the desire to associate the commemoration of the sixty years' reign of Her Majesty with a scheme for the benefit of the sick and injured poor of Glasgow and neighbourhood, which has led to the proposal for the reconstruction of the Royal Infirmary." As the senior member of the staff of the Royal Infirmary, he said that not only were those present not antagonistic to the Royal Infirmary, but they had the strongest possible sympathy with the desire that everything should be done to make it more effective in the work it was doing.

Dr. Perry seconded.

On the proposal of Dr. Lindsay Steven, seconded by Dr. Barlow, it was agreed to add to the resolution the words, "and cordially recommends the proposal to the benevolence of the citizens of Glasgow."

The resolution was then carried unanimously.

Dr. Ebenezer Duncan moved:—"That this meeting of the medical profession of Glasgow and the West of Scotland is of opinion that the reconstruction of the Royal Infirmary is necessary, but that an hospital reconstructed in accordance with either of the schemes suggested in the published appeal for subscriptions would be seriously defective, inasmuch as the site available for building is already overcrowded according to modern ideas, while it is proposed in both schemes to increase the accommodation." The statement published by the Lord Provost and his committee showed that they had not the necessary knowledge to guide them in determining what kind of an infirmary should be placed upon that site. That the reconstruction of the Royal Infirmary was necessary was clearly brought out by a plan he exhibited. Light and air were cut off from one of the pavilions. The front building, five storeys in height, faced the south, and as the prevailing winds were from the south-west, the buildings to the east and west were, to a large extent, cut off from the action of these winds and from sunlight. The wards had not only about double the number of patients that they ought to have, but they had not

the sanitary appliances in connection with them that modern hospitals had. The ventilation was still exceedingly defective. The old fever-house was also very defective, the arrangements not being up to modern standards. The surgical house, however, was pretty much the same as in a great many modern hospitals. The only objection to the site was that the surroundings were not by any means ideal. In the immediate vicinity were two large graveyards. The present accommodation for officials was insufficient. There were 100 servants, mostly scrubbers, lodging outside coming into the wards from the crowded districts round about. That was very objectionable. By one of the schemes it was proposed to add 90 beds and by the other 150 beds on the already overcrowded site on which there were at present 600 beds. He maintained that there ought not to be more than 400 beds in an hospital on the present site. The proposed buildings would perpetuate many of the very objectionable features of the existing buildings. There would not be sufficient air space between the pavilions. According to modern ideas there should be 60 to 100 square yards for each bed, but in the proposed buildings they would not have half that. In a matter like this it was the duty of the medical profession to make its voice heard. It was not only a question of money, but of saddling the profession for 50 or 100 years with a building unsuitable for the treatment of the sick poor.

Dr. Johnston Macfie seconded the resolution.

Dr. Robert Bell claimed to be heard as the only man who had had anything to do with hospital construction during the last few years. He had been consulted by the Assistance de Publique of Paris as to the ventilation of the hospital of St. Antoine, which was being rebuilt on the old ground, and he had visited Paris twenty times during the past two years in connection with his system of ventilation. That system, he held, would obviate the objections which had been raised to this proposal. In the pavilions of that hospital there was a maximum of 17,000 cubic metres and a minimum of 10,000 cubic metres of air passing through every hour. It could be heated or cooled as the case required. In one ward they could have the climate of India, in the next that of the Davos Platz in winter.

Dr. Perry said he had been connected with the Royal Infirmary for forty years and had had a good opportunity of judging of its condition in the past and the present. He had no hesitation in adopting the first part of the resolution that the reconstruction of the Royal Infirmary was necessary, but as

to the second part he could not agree to it. The present site of the hospital, notwithstanding all the objections that had been raised by Dr. Duncan, was under the circumstances the best that could be got. The ground space was sufficient for the construction of a first-class hospital, but no scheme which was confined to the rebuilding of the front of the house alone was worthy of consideration or of the money that would be spent upon it. Nothing but taking down the east surgical building and the Castle Street as well as other houses, and reconstructing on the whole available site would be sufficient or should be entertained. He believed that by doing so they would be able to construct a new surgical hospital equal to modern requirements. He would, however, strongly deprecate the proposal to increase the number of beds. He did not think that the plan Dr. Duncan had described to them would be suitable for the available space. He thought he knew of another which might be adopted, but he was not an architect and he would not bring it forward. A much better plan would be to build a similar hospital, possibly containing about 200 beds, for the treatment of surgical cases in the East-end.

Dr. Glaister said that they had been listening to a dolorous and dismal tale regarding the condition of the Royal Infirmary twenty-nine or thirty years ago, but it had got no relation whatever to the proposal put before them in 1897. He did not think anybody would object to the major portion of the resolution with regard to reconstruction of the new hospital, and as to the inadequacy of the space at the disposal of the managers of the Royal Infirmary for the building of a new hospital—that might be taken for granted. But the proposal, as he understood it, was to get a certain amount of money for a certain object. It was not anticipated, even according to the most liberal view, that the charity of Glasgow would raise a sufficient sum to rebuild the whole infirmary.

The Chairman said he did not think there was any real difference of opinion in the meeting. The resolution was founded on the statement issued by the Lord Provost. That statement put forward two plans, one of which increased the accommodation to the extent of 90 beds at a cost of 65,000*l.*, and the other increased the accommodation to the extent of 150 beds at a cost of 100,000*l.* The resolution went the length of saying that neither of these plans should be approved. Dr. Perry and Dr. Glaister also said that neither of these plans could be accepted—that no more beds should be put upon the ground.

Dr. Perry said he would propose that the resolution should

read as follows :—"That this meeting of the medical profession of Glasgow and the West of Scotland is of opinion that reconstruction of the Royal Infirmary is necessary, but that the hospital to be constructed on the present site ought not to contain a greater number of beds than is at present in the Royal Infirmary, and that any further accommodation required for accidents and surgical cases should be provided for by the erection of a smaller hospital on a suitable site such as may be determined."

Dr. Glaister seconded the amendment.

Professor Murdoch Cameron supported the amendment. He agreed with those who said that there should be no increase in the number of beds in the new hospital, and that there should be a small hospital in the East-end, so that patients coming from Hamilton and Bothwell would not require to be taken another couple of miles through the city.

Dr. Adams said he did not believe that any man present honestly believed that the bodies in the Necropolis or in the graveyard near the Royal Infirmary had the slightest effect upon the patients in the Royal Infirmary. He thought it was a great pity that such an idea should be mooted and should go forth stamped with their authority.

Dr. Macgregor Robertson held that it was desirable that it should go forth that the hospital should be built in accordance with modern ideas. If Dr. Perry's proposal was to go to the meeting it should be put as a separate motion. The executive committee would never think of building two hospitals, and the object the promoters of the meeting had in view was that the hospital, so far as it was reconstructed, should be reconstructed from top to bottom in accordance with modern ideas.

Dr. Adams suggested that the latter part of Dr. Perry's amendment should be deleted.

Dr. Perry said he was quite willing to adopt the suggestion, and Dr. Glaister, the seconder, assented. The amendment was accordingly put in the following terms :—"That this meeting of the medical profession of Glasgow and the West of Scotland is of opinion that the reconstruction of the Royal Infirmary is necessary, but that an hospital on the present site ought not to contain a greater number of beds than is at present in the Royal Infirmary."

A show of hands was afterwards taken as between the amendment and the original motion, when there voted—For the amendment, 34; for the motion, 21.

The resolution as amended was then put as a substantive motion and was unanimously adopted.

**GEORGE FREEMAN'S CLOSE-SEALED SYSTEM OF HOUSE DRAINAGE.**

IN our issue of March 26 we gave a short account of the exhibit at the Building Trades Exhibition of Mr. George Freeman, Gordon House, Frederick Place, Brighton, which comprised the various patented appliances used in his close-sealed system of house drainage. We now more fully describe them, and print a plan to show their application.

6 inches at the outlet. This enables the 6-inch drain to be brought right up to the outlet, avoiding the necessity of reducing it to 4 inches.

*The Reversible Yard-sink or Gully-trap* has the following advantages. The nose of the gully being longer and further out from the body a better joint can be made and with greater ease than by using the usual pattern. There is an oval opening in the nose (see illustration) closed by a stoneware stopper as in the closet-trap, insuring a clean joint and facilitating the

*The Improved Closet-trap*, made in two designs, No. 1 for use *above* the basement or ground floor, and No. 2 for use *in* the basement or ground floor. In this trap (No. 1), which has a clear 4-inch bore, there is an oval opening in the nose (which is closed by a stoneware stopper), which insures a clean joint

removal of any stoppage from this branch of the drain, which can be done with a rod and the stopper replaced and sealed, thus avoiding breaking open the drain. The gully is made with a reversible top, thus doing away with the use of bends, as it can be set to any angle, insuring a straight line to the

by affording the means of easily removing the burrow of cement which forms in jointing the ordinary closet trap, which often causes a stoppage, and also for clearing away any obstruction, should such occur, without damage to the drain. Through the stopper there is a 2-inch opening, in which is inserted a lead pipe to form the anti-syphonage. No. 2 has the same opening at the nose and is made with a 4-inch bore in the body, widening to

main drain of the building. It is self-cleansing, being made of a round vertical design, and the absence of angles prevents the accumulation of offensive matter, grease, &c.

*The Close-sealed Intercepting-trap* is designed with a very easy sweep, and is the same size bore all through, which prevents it getting choked. It has a tapering clearing-eye enabling the same clean joint to be made at the nose, and an ova

opening on the after part. The stoppers are sealed by a joint of fine mortar being laid on them and a thin layer of gauged cement. This immediately forms the close-sealed arrangement to the interceptor and drain. It is placed within a dry brick-built chamber, and should it become choked at any time the stopper can be taken out of the front clearing-eye, and the stopper of the back oval opening broken, when the soil immediately flows into the sewer. The obstruction being removed, the stoppers can be replaced and sealed down as before without damage being done to the drain or trap. This trap can be set to a fall of from 1 in 60 to 1 in 20 without the danger of lessening the water seal. The following figures give the depth of seal with various falls of drain:—

Fall of Drain.				Depth of Seal.
1 in 30	...	...	...	2½ inch
1 in 40	...	...	...	2¾ "
1 in 50	...	...	...	2¾ "
1 in 60	...	...	...	2¾ "

It has a separate arm on each side, at angles of 35 deg. and 40 deg. respectively, right and left-handed, and it is therefore immaterial on which side of trap the fresh-air inlet or gully for area water is placed.

*Patent Sanitary Pipes and Undrawable Joint.*—This invention provides an improved drain pipe and joint for sanitary purposes, whereby a quicker and easier method is obtained for constructing a drain. These pipes are made at the spigot end on the tapering principle, with a shoulder and deep grooves; the socket is on the bell-mouthed principle with similar deep grooves inside. When jointed together with cement they form a perfect undrawable joint. In constructing a drain with these pipes, the workman must gauge the cement in the ordinary way, then putting a layer or bed of cement in the bottom of the socket, and the same on the top of the spigot end, press the spigot end into the socket and finish the joint with the trowel in the ordinary way. This obviates the necessity of the workman using his fingers in making the joints. These pipes can be

used and jointed by the most inexperienced workman, as they can be laid to a straight line or to an easy curve without splaying the spigot, or any gradient as required, and a smooth regular joint is formed inside of the pipe. They are also better adapted for boggy or new made ground. Should a subsidence occur underneath the drain these pipes will remain as they were laid, the joint being made in such a way that it is practically impossible for the pipes to be drawn apart.

*The Automatic Back-pressure Tidal-valve for Drains* has for its object the prevention of the back flow of sewage and flooding of basements arising from any cause. Should the public sewer become blocked, the valve will immediately shut itself, stopping the water and preventing the basement from becoming flooded, and the rising of foul matter from the drain into the dwelling. As will be seen from the plan, it can be fixed in front of the interceptor.

A most useful invention is the water-seal gauge, by which the water-seal of closet-traps, gullies, or yard sinks and sewer-gas interceptors can be tested without passing the hand into the soiled trap, as has been hitherto necessary. The accompanying illustrations clearly show their use.

### STAFFORDSHIRE GENERAL INFIRMARY.

THE Staffordshire General Infirmary at Stafford, which has undergone complete reconstruction at a cost of about 20,000*l.*, was reopened on the 21st inst. The infirmary itself dates from the year 1766, but the building which has just been practically rebuilt was about seventy years old. Before the alterations it consisted of a single block of buildings, with a central corridor and rooms used as wards opening out of it on both sides—a very usual arrangement fifty to seventy years ago, but making the central corridor dark and preventing any proper cross ventilation to the wards. At the south end of this central block was a wing used for fever patients. The sanitary arrangements throughout and the nurses' accommodation were most defective. After careful consideration, it was decided to pull down all the old buildings with the exception of the central portion, and to devote this to administrative purposes, nurses and servants' accommodation. The provision for patients has therefore been entirely rebuilt, and is disconnected by open corridors from the central or administrative block, and in two pavilions to

the north and south, making an elevation towards the high road of 370 feet in length. The patients are provided for in four large wards, facing east and west, and containing 14 beds each, a children's ward of 12 beds, three isolation wards of two beds each, three isolation wards of one bed, and two day-rooms, making a total of 80 beds. Detached sanitary blocks are provided at the ends of the large wards, and the whole are built on arches, so that there is a complete circulation of air round them. Attached to the north block is a new operating theatre, served with a patients' lift and with a preparation-room adjoining. Each block is reached by a stone staircase, and at the further end is an external escape in case of fire. The out-patients' department, with its dispensary, consultation and examination-rooms, is placed under a portion of the south block, and a mortuary and post-mortem-room have been arranged in the grounds. In the centre block are the kitchens, doctors', nurses' and servants' dining-rooms. On the ground-floor are situate entrance and board-room, receiving-room for patients, doctors' and matron's rooms, while on the first-floor are nurses' cubicles and sisters' and nurses' sitting-rooms, and on the floor over servants' bedrooms. The building is heated throughout with hot-water radiators, the large wards having a combination of an open stove and hot water which answers well, the fresh air supply to these wards being drawn from the outside and warmed before its entry into the wards, by passing through these radiators. The air is extracted by means of flues in the walls collected in flues in the roof, and finished with Kite's extract ventilators. The walls of the wards have all their corners rounded and finished in Keene's cement and painted. The floors are laid in polished oak. Everything has been done to put the patients under the most favourable conditions known to modern sanitary science. Externally the walls generally have been faced with rough-cast, partly for the sake of warmth and partly as an easy means of making the old central block harmonise with the new red brick facings being employed round the window and door openings. A new central porch has also been erected, and the external appearance has been further improved by the erection of a new boundary wall and entrance gates towards the road. The work has been carried out in two contracts, the first being the north wing, which was built by Mr. Espley, of Stafford; the second including the south wing, the isolation and children's wards, and the remodelling of the central block, being carried out by Mr. J. Gething, of Shrewsbury. Mr. Pebworth and Mr. Tanner have acted as clerks of works. Mr. Aston Webb, of Queen Anne's Gate, S.W., is the architect, and the work has been carried out at a cost of 20,000*l.*

### ORMOND QUAY PRESBYTERIAN CHURCH, DUBLIN.

THE Ormond Quay Presbyterian church building has been enlarged by the addition of a hall and Sunday schools. The new building, which has been erected on the site of Nos. 3 and 4 Upper Ormond Quay, is nearly completed. It was considered advisable to adopt a different style from that of the church adjoining, and accordingly a modified Jacobean design was selected as being appropriate, and as allowing of the introduction of an unusually large projecting oriel window towards the street, which forms the main feature of the front elevation, and also adds to the area of the rooms on the two upper storeys. The front is faced with granite and red brick. The former comes from the Glencree quarries, and comprises the whole of the ground floor and quoins, dressing cornice, balustrading, &c., over same. The plain surfaces of wall are filled with red brick from Portmarnock, co. Dublin. The harmony of the quiet deep grey tones of the stone with the rich warm colour of the brick is good. The large oriel is constructed entirely of timber, and sits upon a projecting granite base corbelled out to about 2 feet 6 inches in advance of the face of the wall. There are two entrance doorways from the street, one on each side, with a large shop window occupying the space between, from the cornice of which springs the base of the projecting window. The entrance on the eastern side leads direct to the shop, which occupies the greater portion of the ground floor and which is separated from the rest of the building by solid brick walls and fireproof floors. All the floors are constructed of concrete carried on steel girders, and no timber is used in their construction except the flooring boards themselves. The door on the western side leads to the upper part of the house by a wide hall and stairs. At the foot of the latter are placed a cloak-room, a lavatory for gentlemen and an entrance to the church. The larger meeting hall is a fine apartment, occupying the whole front of the house and 17 feet high from floor to ceiling. The walls are panelled in wainscot for nearly half the height of the room and the ceiling is coved, the upper portion of the walls being divided into compartments by pilasters in plaster. Mantelpieces of polished walnut and marble, specially designed, are provided. The storey over this is divided into two apartments, so arranged as to form one or two rooms as may be needed, and these are also wainscotted.

Off the upper stairs a ladies' lavatory is fitted up. The building has been erected from the designs and under the superintendence of Mr. W. M. Mitchell, R.H.A., architect, the contractor being Mr. John Good, of Great Brunswick Street, who has executed the work in an excellent and substantial manner.

### PORTSEA ISLAND BUILDING SOCIETY.

ON December 14, 1891, the Society, which did a banking business and financed several builders, failed, with liabilities exceeding 800,000/. For some time there was the prospect of protracted litigation, but this was avoided by the passing of a special Act of Parliament, under which Lord Macnaghten became the hon. arbitrator, assisted by a local committee. The Act placed shareholders and depositors on an equal footing so far as dividends were concerned, and this met the greatest difficulty that the liquidators had to encounter. It required 40,000/. to pay 1s. dividend, and in the process of winding up dividends amounting to 9s. in the pound have been paid. Tenders for the purchase of the remaining properties in the hands of this Society have been forwarded to Lord Macnaghten, the hon. arbitrator, and on the realisation of the property the last dividend will be paid and the Society will be closed. At the present moment the cash in the bank amounts to over 20,000/., and this amount is equalled by the tenders for the remaining property, so that as soon as this is sold arrangements will be made for the payment of a final dividend of 1s. in the pound, making a total of 400,000/. that has been recovered from the wreck of the Society. After the payment of the final dividend there will be a balance left to wind up the litigation that is still pending.

### ENLARGEMENT OF THE GUILDHALL SCHOOL OF MUSIC.

THE almost phenomenal success of the Guildhall School of Music has demanded the serious consideration of the music committee appointed by the Corporation of London as to the best means of enlarging the present school premises. It appears that, in 1887, 2,813 students attended the school; this number increased in 1896 to 3,527. Many students are now applying for admission who cannot be accommodated on account of the limited number of classrooms, while some of

the professors are giving lessons in rooms not at all suited to that purpose. A large practice-room is also needed for the use of the choir, orchestra and the operatic and dramatic classes.

The Corporation have wisely decided that the piece of land on the Victoria Embankment adjoining the school (fortunately reserved for possible necessities) shall be utilised for the new wing.

Mr. Andrew Murray, the city surveyor, in his explanation of the proposed plans, describes the new orchestral saloon as a chamber 47 feet wide by 55 feet long; it will have a stage 47 feet by 14 feet by 27 feet high, with suitable dressing-rooms, &c. The chamber is to seat about 600, 410 on the ground floor and the remainder in the gallery. The second, third and fourth floors of the new building will be occupied by classrooms, and the height of the façade will be 66 feet 6 inches from the pavement to the parapet.

To prevent fire there will be no open fireplaces. The heating of the building is to be effected entirely by means of hot air. For the same reason all the floors will be fire-resisting.

The front walls are to be built of Portland stone; those at the rear of white glazed bricks. The style of architecture will be somewhat similar to the present building, but owing to the greater height the details will be bolder and the piers and pilasters in greater relief. The total estimated cost is 20,500/.

That this undertaking will be a good job for the successful contractor may be judged from the fact that the original building only cost 25,930/.

### PROPOSED REBUILDING OF THE CENTRAL CRIMINAL COURT.

THE finance committee of the Corporation have recently considered the question of finance in connection with the proposed rebuilding of the Sessions House in the Old Bailey. They state in their report that they had obtained from the surveyor an approximate estimate of the probable cost of carrying-out the sketch plans for the new courts, and they had instructed the officers to report as to the several sources from which the requisite funds might be obtained. The cost of the proposed rebuilding and complete equipment of the Sessions House, with its various courts and offices, was estimated at 120,000/. It was also proposed to utilise the female wing at Newgate, the freehold of the Corporation, of an estimated value of 21,750/. The land on which the existing Sessions House and courts stand,

## VOLUME LVI. OF THE ARCHITECT.

Handsomely bound in Cloth. Gilt Lettered. Price 12s. 6d.

OFFICE: 175 STRAND, LONDON, W.C.

with the adjacent yard, is estimated to be of the value of about 50,000*l.*, and is also the freehold of the Corporation. The utilisation of the suitors' fund of the City of London Court, now amounting to 70,585*l.*, was a suggestion which received due attention; but although, no doubt, under certain conditions the Corporation, if it were deemed advisable, could thus utilise the fund, the committee did not in all the circumstances advise the adoption of such a course in this instance. In their judgment the present state of its finances would not justify the sinking by the Corporation of such a sum as 70,585*l.*, or anything like that sum, in connection with an undertaking which must necessarily be absolutely unremunerative. Further than that, they did not consider that the present state of its finances would justify the Corporation in parting with the female wing of Newgate for that purpose unless some adequate pecuniary benefit could be made to accrue to the Corporation thereby. It must not be forgotten that in 1902 the grain duty, now producing on an average 18,000*l.* per annum, would come to an end, when the open spaces belonging to the Corporation would have to be wholly maintained out of the City's cash in the absence of Parliamentary assistance, and the Corporation would be left to discharge the outstanding loan raised upon the credit of the grain duty, now amounting to 194,000*l.* The trial of prisoners at the Central Criminal Court was not restricted to persons committed from the City and County of London, but included prisoners from Middlesex, Essex and Surrey, and it might not be unreasonable to approach those various counties and suggest the desirability of a contribution being made by each towards the cost of the proposed rebuilding, such contributions to be based upon the proportions in which the respective counties are liable to contribute towards the salaries of the officers of the court—viz. London (including the City), 35-40ths; Middlesex, 2-40ths; Essex, 2-40ths; and Surrey, 1-40th. It could not be urged against the Corporation that in making such a suggestion it was not acting reasonably in the matter, inasmuch as it must be carefully borne in mind that the whole of the new buildings would stand on freehold property of the Corporation, from which no income would be derived, and that the Corporation, in addition to paying out of the City's cash the salaries of the Recorder and Common Serjeant, would also continue to bear the other expenses in connection with the maintenance of the courts and buildings, including supervision and repair. The Central Criminal Court holds almost continuous sittings far more than any other court of assize, and prisoners are always sent for trial there from the counties

enumerated in far greater proportions than those committed from the City itself. In cases of offences on the high seas and other places within the jurisdiction of the Admiralty of England the prisoners must be tried at the Central Criminal Court. For these reasons the finance committee recommend that the whole cost of the proposed rebuilding of the Sessions House and courts, including the additional land required for the purpose and the premises to be used during rebuilding, be defrayed by means of a county rate restricted to the City area. The report will be considered at a future meeting of the Corporation.

### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

#### APPLICATIONS FOR PATENTS.

9223. William Greenwood, for "Improvements in safety-chain fastening for doors."

9226. George Rockliffe, for "Improvements in door-frames for ships and like structures."

9230. Archibald Ansell, for "Improvements in sliding sashes and frames."

9237. John Douglas, for "An improved ventilator."

9270. Sidney Lawrence, for "Improvements in and relating to sash-fasteners."

9271. Sidney Lawrence, for "Improvements in connection with the raising and lowering of window and like sashes."

9272. George Henry Young, for "An improved method of and tool for forming grooves in wood and other materials."

9357. William Jackson, for "Improvements in or relating to window-sashes or frames."

9466. Joseph Kaiser and Joseph Wilbrand, for "Improvements in door-fastenings."

9479. Julius Heinrich Brückner, for "An improved self-closing door-hinge."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

# THE NEW EXPANDED METAL

Mesher from  $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to  $\frac{1}{8}$ th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

**THE EXPANDED METAL COMPANY, LTD.,**

**39 UPPER THAMES STREET, LONDON, E.C.**

Telegraphic Address, "Distend, London."

Works—WEST HARTLEPOOL.

Telephone No. 1829.

## EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

## NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

*For Advertisement Scale, see page xiii.*

## COMPETITIONS OPEN.

**BOOTLE.**—July 31.—Competitive plans are invited of a technical school to be erected at the corner of Balliol Road and Pembroke Road, at a cost not exceeding 15,000*l.* Premiums of 50, 30 and 20 guineas will be awarded for the designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. J. H. Farmer, town clerk, Town Hall, Bootle.

**MORECAMBE.**—Competitive designs are invited for the erection of a new hotel, to be called the Hôtel Métropole, at a cost of 30,000*l.*, at this picturesquely situated and rapidly increasing fashionable seaside resort. Designs must be sent in under motto on or before June 16, 1897.

## COMPETITION DECIDED.

**KNARESBOROUGH (YORKSHIRE).**—Mr. W. D. Caröe has placed first the plans submitted by Mr. George H. Barrowcliff, architect, of Loughborough, in public competition for the Knareborough Grammar School, designed to accommodate 100 scholars, thirty boarders, with head-master's house and a complete technical school.

## CONTRACTS OPEN.

**ABERDEEN.**—May 18.—For erection of the Morison Wing, Scott's Hospital, Huntly. Mr. A. Marshall Mackenzie, architect, 1 Bon Accord Street, Aberdeen.

**ABERDEEN.**—May 11.—For erection of dwelling-house at Hilton, Lumphanan; new byres at Wester Kincairgie, Lumphanan; men's sleeping-place at Bogloch, Lumphanan; alteration on dwelling-house at Knappyrround, Lumphanan. Messrs. Cochran & Macpherson, advocates, 152 Union Street, Aberdeen.

**ALVESTON.**—May 15.—For erection of parish hall and commemorative building. Mr. F. Bligh Bond, architect, Alliance Chambers, Corn Street, Bristol.

**BAILDON.**—May 11.—For erection of residence, stabling, &c., in Langley Lane. Messrs. Fairbank & Wall, architects, Craven Bank Chambers, Bradford.

**BARNESLEY.**—May 10.—For pulling-down shop premises, May-Day Green, Barnsley, and erection of new buildings. Mr. Herbert Crawshaw, architect, 13 Regent Street, Barnsley.

**BARRY DOCK.**—May 10.—For erection of a chapel and schoolroom at Holton Road, Barry Dock. Rev. T. Pandey John, 25 Regent Street, Barry Dock.

**BATLEY.**—May 12.—For erection of additions to water-tower at Hick Lane Mills. Messrs. Holtom & Fox, architects, Westgate, Dewsbury.

**BATLEY.**—May 14.—For erection of additions and alterations to the National Schools. Messrs. Holtom & Fox, architects, Westgate, Dewsbury.

**BEDALE.**—For erection of a classroom for the boys' school and for alterations in the infants' school. Master, Wycar, Bedale.

**BELFAST.**—May 11.—For erecting lavatory and water-closet accommodation at Lock Wards, also providing and laying new sewer from weighbridge to Lisburn Road. Mr. James C. Neeson, clerk, Workhouse.

**BELFAST.**—For erection of business premises, Berry Street. Mr. W. J. Moore, architect, Whitehall Buildings, Ann Street, Belfast.

**BILLERICAY.**—May 11.—For supplying and laying wood-block flooring to two dayrooms at the Union House. The Master.

**BRADFORD.**—May 10.—For erection of a gymnasium at the Nutter Orphanage. Mr. T. C. Hope, architect, Old Bank Chambers, Bradford.

**BRADFORD.**—For erection of two houses and house and shop in Lilycroft and Westfield Roads, Manningham. Messrs. Fairbank & Wall, architects, Craven Bank Chambers, Bradford.

**BRIDGNORTH.**—May 19.—For erection of a new mixed and infant school at Highley, near Bridgnorth. Messrs. R. Scrivener & Sons, Howard Place, Hanley.

**BRIDGWATER.**—May 7.—For alterations and additions to and to the Board schools, Albert Street. Mr. A. Basil Cottam, architect, Eastover, Bridgwater.

**BRIGHOUSE.**—May 25.—For erection of an engine, boiler and press-house, chimney-shaft and other buildings, also for large sewage-tanks, subway and other works. Mr. A. M. Fowler, 1 St. Peter's Square, Manchester.

**BRISTOL.**—May 10.—For enlargement of the premises of Herbert Ashman & Co., Broadmead and Silver Street. Mr. James Hart, architect, Liverpool Chambers, Corn Street, Bristol.

**BROCKLEY.**—May 11.—For erection of public conveniences at Hilly Fields. Architect's Department, County Hall, Spring Gardens, S.W.

# ALABASTINE. In dry form, and ready for use by adding cold water. Patented.

The original inventor of Alabastine, Mr. M. B. Church, having been successful in patent litigation against a licensee, has now established works in London, and will push Alabastine forward to more general use, not only for plain, permanent wall and ceiling coating and decoration, but for relief work, *i.e.*, Alabastine combing, stippling, glazed tile-work, &c., also high relief decoration in freehand, aided by a machine which is just being brought out for doing such work direct on walls and ceilings. Write for **free samples**, descriptive circular, samples of tints, and a pocket sample with 35 coats on, as if used on walls as many years.

# JELSTONE.

Mr. Church is also making Jelstone, a superior distemper, which is like Alabastine in its patent form, adapting it for use in cold water. It takes the place of whitening and size, as painters mix distemper, being sold in barrels at about the price of whitening and size, ready for use by adding cold water only. **We take the risk**, by guaranteeing satisfaction on promise of a careful trial of Jelstone in comparison with any other distemper; it requires no experimenting or variation from usual methods to apply it properly.

Jelstone does not form permanent coatings adapted to repeating indefinitely without taking off, as Alabastine does, nor is it a foundation for paint or paper, as Alabastine is, neither is it suitable for the relief work, but is guaranteed to be a very superior distemper, well sized, but easily removed each time to renew, as painters do with whitening and size.

The great advantage in the cold water form is obvious, but the superior working, covering qualities, and artistic merits of these articles are the main advantages to decorators. We have practical men to look after work, on request, when specified by Architects.

**ALABASTINE COMPANY (British), Limited, Church Street, South Lambeth, London, S.W.**  
(NEAR OVAL ELECTRIC STATION).

**BUCHAREST.**—May 18.—For construction of an industrial school at Jassy. Application to the Roumanian Ministry of Agriculture at Bucharest.

**BURNLEY.**—For pulling-down, rebuilding and extension of assembly-room, &c. Mr. Thos. Bell, architect, Burnley.

**CANTERBURY.**—May 13.—For demolition of seven cottages in Ruttington Lane, Canterbury, and other works in connection therewith, for the Trustees of St. John's Hospital. Mr. W. J. Jennings, architect, 4 St. Margaret's Street, Canterbury.

**CARDIFF.**—May 10.—For erection of chapel and buildings. Messrs. J. P. Jones, Richards & Bugden, architects, 18 St. Mary Street, Cardiff.

**CARDIFF.**—May 17.—For completion of St. Catherine's parish church. Mr. George E. Halliday, architect, 14 High Street, Cardiff.

**CARDIFF.**—May 17.—For erection of a branch free library at the docks. Mr. W. H. Dashwood Caple, architect, 1 St. John's Square, Cardiff.

**CASTLEFORD.**—May 10.—For erection of public hall and offices in Jessop Street. Mr. R. M. McDowall, architect, Castleford.

**CLAYTON-LE-MOORS.**—May 15.—For erection of thirteen houses in one lot. The Directors, Co-operative Society, Clayton-le-Moors.

**CLOUGHFOLD.**—May 15.—For the pointing and painting of thirteen cottages. The Weavers' Office, 30 Bacup Road, Cloughfold.

**CORNWALL.**—May 19.—For erection of a range of buildings, consisting of cattle, root, calves and trap-houses, at Little Trewirgie, in the parish of Probus. Mr. George Gow, Tregothnan Office, Truro.

**CROMER.**—May 17.—For erection of a boiler and exhaustor house, sheds over purifiers and oxide floor, and other work. Mr. Percy Griffith, 55 Parliament Street, Westminster, S.W.

**CRONDALL.**—May 17.—For erection of an infirmary on the ground adjoining the school. Mr. A. Ansell, architect, 63 Finsbury Pavement, E.C.

**DENTON.**—May 15.—For construction of a river retention wall, about 120 yards in length, near to the outfall sewage works. Messrs. Lomax & Lomax, civil engineers, Fold Street, Bolton.

**DEVIZES.**—May 18.—For building a recreation-room at the Wilts County Pauper Lunatic Asylum. Mr. Charles S. Artyl, county surveyor, County Offices, Trowbridge.

**DEWSBURY.**—For erection of boundary wall, &c., at West-town. Messrs. Holtom & Fox, architects, Westgate, Dewsbury.

**DOWNPATRICK.**—May 13.—For erection of two dwelling-houses on the Circular Road. Mr. Edward Lascelles, Market Street, Downpatrick.

**DUBLIN.**—May 12.—For alterations and additions to the workhouse kitchen and other apartments in the workhouse. Mr. John O'Neill, clerk, North Brunswick Street, Dublin.

**DURHAM.**—For additions to the Primitive Methodist chapel. Messrs. Plummer & Burrell, architects, Market Place, Durham.

**DURHAM.**—For re-covering the roof of Windlestone Hall with lead and slate. Agent, Estate Offices, Windlestone, Ferryhill, co. Durham.

**DURHAM.**—For erection of new premises, Pelton Fell. Mr. Edwin Bowman, architect, County Chambers, 52 Westgate Road, Newcastle.

**DURHAM.**—May 11.—For additions to co-operative store, Springwell. Mr. H. Miller, architect, Felling.

**ESCRICK.**—May 20.—For additions and alterations to the police-station and court-house. Mr. Alfred Beaumont, county surveyor, County Hall, Beverley.

**ESSEX.**—May 12.—For repairs to and alterations of Tolleshunt D'Arcy Church. Rev. R. V. O. Graves, the Vicarage, Tolleshunt D'Arcy.

**GLAMORGAN.**—May 15.—For erecting a new stage, staircases, lavatories, supper-room, ventilation, &c., for the Committee of the Town Hall Trust, Bridgend. Messrs. Lambert & Rees, architects, Bridgend.

**GLAMORGAN.**—May 15.—For certain work required in erecting a new stage, staircases, lavatories, supper-room, ventilation, &c., for the Town Hall Trust, Bridgend. Messrs. Lambert & Rees, architects, Bridgend.

**GOSPORT.**—May 12.—For erection of boundary wall and entrance gates at depot, South Street, for the Gosport and Alverstock Urban District Council. The Surveyor, High Street, Gosport.

**GRAYS.**—May 18.—For erection of a portion of a school at Bridge Road. Mr. Christopher M. Shiner, architect, 2 Walbrook, E.C.

**HALIFAX.**—May 18.—For alterations and additions to Shaw Lodge. Mr. W. Clement Williams, architect and surveyor, 29 Southgate, Halifax.

THE

## TRADE NOTES.

IN our notice in the issue of April 23 respecting the firm of G. Lock & Co., Limited, we should have mentioned that Mr George Lock will act in conjunction with Mr. William Wallace as managing director.

THE Verdin Technical Schools, Northwich, are being ventilated by means of Shorland's patent exhaust roof ventilators and special inlet panels, by Messrs. E. H. Shorland & Brother, of Manchester.

THE handsome new theatre which Mr. Beerbohm Tree has just opened on the site of the old Her Majesty's Theatre in the Haymarket, is fitted with all the latest improvements and appliances to meet the London County Council regulations and ensure the safety of the audiences in case of fire. The old theatre was twice saved from destruction by the Merryweather fire apparatus, with which it was fitted, and Mr. Tree's new building has been provided by the same firm with a complete system of fire-mains and hydrants connected to the constant high-pressure water service.

## ELECTRIC NOTES.

THE St. Helen's gas and lighting committee have resolved to duplicate the electric light plant at an estimated cost of 7,500*l*. There will also be 7,500*l*. for mains, and 2,000*l*. for excess of expenditure on present works, making a total of 17,000*l*., which the town clerk has instructions to borrow.

A LOCAL provisional order Bill has been passed providing for an electric light supply to the borough of Dudley.

## BUILDING AND BUILDERS.

RAPID progress is being made by the contractors under the North-Western Railway with the construction of the extensive and commodious station at Llandudno Junction.

PLANS have now been adopted for the restoration of Bradford parish church as a memorial of the late Archdeacon Bardsley. The estimated cost is 4,000*l*.

THE York Master Builders' Association have granted the plasterers an advance from 8*d*. to 9*d*. per hour, and bricklayers and plasterers' labourers an increase from 5½*d*. to 6½*d*. per hour, on condition that they undertake not to make a further application for an advance next year. The bricklayers had also asked for an advance from 8*d*. to 9*d*. per hour, but subsequently withdrew the request.

BATHS and washhouses are to be erected in Pitfield Street, Hoxton, and the foundation-stone was laid on the 1st inst. The first class swimming-bath will be 100 feet by 40, the second class swimming-bath somewhat smaller; there will be many slipper-baths, besides accommodation for fifty washers. The site and building will cost 51,093*l*.

THE foundation-stones of the new Wesleyan day and Sunday schools and lecture-hall at Garston were laid on the 29th ult. The buildings are being erected on land adjacent to Island Road Wesleyan church by Messrs. Turner & Moss, Garston, from plans by Mr. Rhind, architect, Liverpool, and are estimated

FIRE AT THE WORKS OF THE ANAGLYPTA CO., DARWEN, LANCASHIRE.

The door we fitted in these works, although subjected to a heat intense enough to melt brass taps and fittings near it, withstood the heat perfectly, and can now be inspected at our works in Manchester, fit for duty. The metal sheets have expanded without becoming detached, whilst the wood is simply charred to a depth of about ½ of an inch.

FULL PARTICULARS AND ESTIMATES FREE FROM

**DOWSON, TAYLOR & COMPANY, Ltd.,**  
14 VICTORIA STREET LONDON; AND BLACKFRIARS BRIDGE, MANCHESTER.

to cost 3,100*l*. The schools will accommodate 339 scholars, and in addition there will be a spacious lecture-hall and ladies' parlour, and a library.

A MISSION church is being erected in connection with St. Peter's Church, Woolton, at Hunts Cross, an outlying portion of the parish.

THE lady chapel of the church of St. Bartholomew-the-Great is to be reopened on Tuesday, May 18, by the Bishop of London. The ceremony is to be followed by a luncheon in the great hall of St. Bartholomew's Hospital, by way of celebrating the completion of the work. The bishop will occupy the chair, and a great effort is being made to enable him to announce that the chapel has been opened free of debt, but 400*l*. is still required.

THE corner-stone of a new Episcopalian church was laid at Stourton on the 1st inst. The building which is to take the place of St. Andrew's mission church, which has become too small, will be of the late fourteenth-century style of architecture. It will be a brick building, with red Dumfries stone dressings on the outside and with a roof of red Staffordshire tiles. The dressings of the interior will be of Harehills stone. The church will consist of a nave and aisle, chancel, organ chamber, vestry and heating chamber. On the north side there will be a small chapel, providing accommodation for about twenty-five people. An octagonal turret will rise from the north-east corner of the nave. The aisles are to be divided from the nave by two arcades of five arches each. Above these there will be a range of three-light traceried clerestory windows. A large five-light east window and clerestory windows on the north and south will light the chancel. The main entrance to the church will be at the north-west corner. There will also be doors at the north and west ends of the building. The chancel ceiling will be arched and panelled, and the roof of the nave will also be subdivided into panels. A floor of wood blocks, deal seats and an oak altar complete the building. The estimated cost, including extras, is a little over 5,000*l*. Mr. Hodgson Fowler, of Durham, is the architect, Mr. T. A. Bolton, of York, clerk of the works, and Mr. Isaac Gould, the contractor.

A NEW Wesleyan church is to be built at Burley, and the foundation-stone, memorial-stones and "commemorative bricks" were laid on Saturday afternoon. The site is in Cardigan Lane. At present this is only a narrow, inconvenient road, but it is said that the Corporation intend to widen it,

so as to provide a satisfactory thoroughfare leading from Burley to Headingley. Then the situation of the chapel will be admirable. The premises have been designed by Mr. G. F. Danby, architect, of Leeds. They comprise a chapel, school-room, infants'-room, church parlour, minister's-room and twelve vestries or classrooms. The style of architecture adopted is the Decorative Gothic. The chapel is being built of stone, lined with brick, while all the internal woodwork will be of pitch-pine. A leading feature of the front elevation will be a double doorway with granite columns, carved capitals and moulded arches, terminating in a gable. Over this there is to be a five-light traceried window. At the south-east corner a handsome tower and spire will rise to a height of 110 feet. Inside the tower there will be a stone staircase leading to the gallery in the chapel, and a similar staircase will be provided at the opposite corner of the building. The chapel is to be 84 feet long, 48 feet across the nave and 57 feet across the transepts. Accommodation will be provided for 480 persons on the ground floor and for 320 in the gallery. The chancel will be separated from the chapel by a moulded arch supported on granite columns, with carved bases and capitals. At this end of the chapel there will be a large traceried circular window filled with stained-glass, while two-light traceried windows terminating in gables will be placed at the side and filled with leaded lights. The open-timbered roof will in the centre rise to a height of 40 feet. In heating the premises the low-pressure hot-water system is to be applied. Fresh air will be admitted to the chapel and various rooms by air inlets and ventilating radiators, the foul air being carried off by roof ventilators and flues. The contracts at present let amount to about 6,000*l*. The contractors are:—Mr. C. Myers, masonry; Messrs. Ledgerd & Son, joinery; Mr. H. Boston, plumbing and glazing; and Messrs. J. Atkinson & Son, slating.

### VARIETIES.

ST. ANNE'S Roman Catholic church, Stretford, having been restored and decorated at the cost of Sir Humphrey de Trafford, was reopened on Tuesday last.

THE Ayr E. U. church was reopened on Sunday, the 2nd inst. The building has been almost entirely renewed, and the electric light has been introduced.

ESTIMATES and DESIGNS for JUBILEE DECORATIONS submitted

A NEW English church was opened in Zürich on Sunday last. The building, which holds 300 people, and site have cost about 5,000l.

At the Kibble Reformatory, Paisley, the new south wing which has been added to the institution was opened on the 28th ult. The new wing contains, besides other apartments, a large reading-room and a dormitory with forty-two beds.

The church of St. John the Evangelist, Walton-on-the-Hill, having undergone considerable extension, will be reopened on the afternoon of Monday, May 31. The cost of the extension will be 3,400l.

THE Archbishop of Canterbury opened the new library at Hereford Cathedral on the 30th ult. The building occupies the exact site of the Mediæval library in the Bishop's Cloisters, and has been erected with a legacy of 4,000l. left by Canon Powell. Sir A. Blomfield was the architect.

PORT VICTORIA pier, the terminus of the Hundred of Hoo Railway, was reopened on the 1st inst. by the South-Eastern Railway Company, after being closed for seven months for extensive repairs. Railway traffic to Port Victoria was resumed, and the service of boats between Sheerness and Port Victoria will run as heretofore, thus bringing Woolwich Arsenal and North Kent in direct communication with Sheerness and the entrance to the river Medway.

A NEW Middlesex county upper and technical boys' school at Isleworth, built jointly by the Middlesex County Council, the British and Foreign School Society and the governors of the Isleworth Blue Schools, was opened on Saturday, the 1st inst., by the Earl of Jersey who was accompanied by the Countess.

A FINE pile of buildings, erected by the Corporation in St. Michan's Street, Dublin, directly facing the western side of the new vegetable, fruit and fish market, has now been completed, and will be opened by the Right. Hon. the Lord Mayor on Tuesday, the 11th inst., at eleven o'clock.

The new premises of the Hindley Conservative Club in the Ince Parliamentary Division were opened on the 1st inst. by Lord Balcarras, the member for the Chorley Division. The new club house, which has cost something like 3,000l., has been constructed in the principal street of the town, and is one of the most commodious and best equipped clubs in the county.

The Midland Great West Company's new hotel at Malranny, which has recently been erected, and will shortly be

opened for visitors, is very prettily situated on the shores of Clew Bay, and stands in its own grounds, the extent of which is about fifty acres. It has been fitted with all modern conveniences, electric light, &c., and is altogether very comfortable and spacious. The grounds have been carefully laid and planted by the company, the walks especially being very ornamentally laid out. The scenery around is picturesque, and a fine view can be commanded of it from the hotel. The hotel is also supplied with a first-class billiard-room. It is within easy distance of Achill Island by rail or road.

THE thirty-fifth general meeting of the shareholders of the London and Lancashire Fire Insurance Company was held on the 29th ult., when the annual statement and balance sheet for the year ending December 31, 1896, were submitted. The net premium income amounted to 836,165l., the profit on the working of the business to 84,800l., and the interest on investments to 36,116l. The total surplus on the year's operations was consequently 120,916l. The directors recommend the payment of the usual dividend of 20 per cent. upon the paid-up capital (10s. per share), which was duly confirmed. The reserve funds and paid-up capital of the company now amount to 1,085,944l.

A NATIVE of Kilmarnock proposes to erect and present to the town a building, at a cost of 8,000l., to be used as a public library and museum. It is to be erected on the site of the present library buildings at Elmbank. This generous gift will meet a want that has been felt in the town. Since the adoption of the Public Libraries Act by the community the library and reading-room have been very largely taken advantage of, and the accommodation in Elmbank House has been found to be far too limited. The museum contains the valuable geological collection presented to the town by Mr. James Thomson, F.G.S., and it has for some time back been a matter of regret that that collection, for want of room, has not been properly displayed, but this difficulty will be overcome by the gift in question.

A CENTENARY hall and other new buildings, which have been added to the Jews' Hospital and Orphan Asylum at West Norwood, were opened on Monday, the 3rd inst., by H.R.H. the Duke of Cambridge. The centenary hall is a handsome structure, built in the Domestic Gothic style, and it has three special adornments—an organ, given by Mr. Alexander Joseph; the Faudel memorial window, taken from its former position in the entrance-hall and placed over the gallery, and a large window above the organ, the gift of Messrs. Joseph & Smithem,

**MACKIE'S PATENT "DEFIANCE"  
HYDRAULIC WATERTIGHT FLOOR SPRING AND CHECK.**

Size of Plate,  
12 x 8 in.  
Size of Box,  
10 1/2 x 6 x 3 1/2 in.

**906**  
80/-  
With top centre  
and brass shoe any size.

This Floor Spring is suitable for any sized door, and can be regulated to suit any force required.

The box is watertight and weatherproof, a distinct advantage when fixed in Banks, Board Schools, Libraries, and similar places, where the floors are frequently washed down.

It is also sent complete with an outer box to fix into floor, to facilitate the spring being taken out when necessary.

Working Models of these and other specimens may be seen at our newly-fitted London Showrooms, 57 HOLBORN VIADUCT, E.C.  
Architects and Buyers are respectfully invited to inspect same.

the architects. By the Faudel window the uncle of the Lord Mayor is commemorated, and the centre panel of the other is filled by a portrait of the chief magistrate, the President of the Institution, in his robes of office, on either side being medallions of the founders of the charity, the brothers Abraham and Benjamin Goldsmid. The side windows contain medallion portraits of deceased presidents, vice-presidents and treasurers. The artistic effect of the Elizabethan front has been enhanced by the addition to the main building of a new storey with dormer windows, and a notable feature is the "Henry Behrend" library, which Mrs. Behrend has presented to the Institution in memory of her late husband, who was for some years President and rendered invaluable services to the asylum. The Duke also unveiled a bust of the Queen which has been placed in the front of the gallery.

THE new schools which have been erected at Penkhill by the Stoke-on-Trent School Board were opened with some ceremony on Monday last. The buildings occupy a position at the junction of Princes Road and Penkhill Street, and adjoining the new Blind and Deaf School at The Mount. They provide accommodation for 470 children, the school being a mixed one on the central hall plan. The schools have been erected by Mr. T. Godwin, of Hanley, from the plans of Messrs. R. Scrivener & Sons. Subsequently a large party assembled at The Mount, Penkhill, for the formal opening of the premises as a school for the blind and deaf children of North Staffordshire, the place having been acquired and adapted to the purpose by the North Staffordshire Joint School Authority, consisting of representatives of the Stoke, Hanley, Longton, Burslem, Wollstanton and Norton School Boards. The Mount is an oblong building with a semicircular entrance of stone on its west front, whilst a lofty dome gives external grandeur to the structure. It has now been converted into the administrative department of the new Blind and Deaf Schools. There is accommodation for 139 children and the necessary staffs. The whole work has been carried out from the plans and under the direction of Messrs. R. Scrivener & Sons, Hanley.

THE Free High Church, Edinburgh, besides having its interior entirely repainted and redecorated, has just had introduced into it a new pipe organ, a new pulpit and communion table, together with an installation of the electric light. The organ, which has been built by Messrs. H. S. Vincent & Co., Sunderland, to a specification drawn up by Mr. T. H. Collinson, of St. Mary's Cathedral, Edinburgh, consists of a great swell and pedal organ, with twenty-one stops, besides couplers and com-

position pedals. The swell and great organs are placed on the left of the communion table, balancing the canopied pulpit on the opposite side; the pedal organ occupies the centre of the elevation, behind the chairs set apart for the session; while the console is placed some little distance in front of the communion table. The instrument has been enclosed in a handsome case designed by Mr. Henry F. Kerr, architect, in a style to harmonise with the interior of the building, and made of oak like the pulpit and communion table. The mechanical power to the organ is supplied by an electro-motor, which is placed in a receptacle to the left of the instrument. The principal feature of the electric-lighting installation, which is regarded as particularly successful, is an 18-light electrolier that depends from the roof. The whole scheme has cost about 1,500*l.* During the progress of the alterations the congregation worshipped in the Free Assembly Hall. The church was reopened on the 25th.

### AMERICAN NOTES.

IN New York and at the Brooklyn Navy Yard tests have recently been made of the application of the sand blast for the purpose of cleaning iron prior to painting. The apparatus used consisted of a Blake blowing engine and receiver for compressed air and a sand mixer with flexible pipes connecting to the receiver and a working nozzle. The engine was operated at 100 lbs. pressure from the boiler of a road rolling machine. The gauge showed a pressure of from 18 to 20 lbs. of air. The air at this pressure was forced through the mixer, and, taking up the fine natural sand therein contained, forced it through a 2½-inch hose 30 feet in length and ¾-inch nozzle upon the surface of the iron at a distance of about 6 inches from the iron. By this method a steel column was cleaned at the rate of nearly 2 square feet per minute, one-tenth of a cubic foot of sand being used per square foot of surface cleaned. By the same method 25 square feet of the bottom of an iron vessel in the Brooklyn Navy Yard was cleaned in about six minutes. The estimated cost in the case of the New York test, on a viaduct, was from ⅓ of a cent to 1 cent per square foot. It is thought that this might be considerably reduced by reducing the amount of scaffolding. The sand blast is said to remove paint, &c., without having any appreciable effect on the solid steel, the surface treated being cleaned of every particle of paint, rust, grease, &c., and the metal being left bright and clear, exposing even the cavities,

Filters.

irregularities and pitting, and edges of cracks and joints being penetrated beyond the limit of accessibility by the brush. The method is said, however, to be very destructive to stone, brick, cast-iron or other crystalline substances.

### THE CRUSHING STRENGTH OF CONCRETE.

IN his last report Mr. A. W. Dow, inspector of asphalt and cements in the Engineers Department of the District of Columbia, describes some investigations he is making to compare the relative strengths of concretes composed of various aggregates, made with natural cement and Portland cement mortars. This comparison is being made by determining the crushing strength on foot cubes of the several concretes at the age of ten days, one month, three months, six months and one year. The ingredients used in the concrete were selected as representing the average material then being furnished the district for that purpose. The composition by volume of the concretes is as follows:—No. 1, 1 part natural cement, 2 parts sand, 6 parts crushed bluestone (average concrete size); No. 2, 1 part natural cement, 2 parts sand, 3 parts crushed bluestone (average concrete size), 3 parts small gravel; No. 3, 1 part natural cement, 2 parts sand, 4 parts crushed bluestone (average concrete size), 2 parts small gravel; No. 4, 1 part natural cement, 2 parts sand, 6 parts of a mixture of 3 of concrete stone to 1 of granolithic; No. 5, 1 part natural cement, 2 parts sand, 6 parts average gravel; No. 6, 1 part natural cement, 2 parts sand, 6 parts bluestone (coarse concrete size); No. 7 same as No. 1, except Portland cement used in place of natural; No. 8 same as No. 2, except Portland cement used in place of natural; No. 9 same as No. 3, except Portland cement used in place of natural; No. 10 same as No. 4, except Portland cement used in place of natural; No. 11 same as No. 5, except Portland cement used in place of natural; No. 12 same as No. 6, except Portland cement used in place of natural.

In mixing the concrete all the ingredients were weighed for each batch, sufficient for 2 cubic feet being mixed at a time. The concretes were mixed by a man experienced in this work in the usual way. The damp sand was first thoroughly mixed with the dry cement, after which sufficient water was added to make a plastic mortar. This mortar was mixed with the aggregate (which had been previously sprinkled) by turning over with a shovel until every stone was thoroughly coated with mortar.

The concrete was then shovelled into the moulds, care being taken that the coarse and fine stone should remain evenly distributed. The moulds were filled to the depth of 4 inches and lightly rammed, this operation being continued until the moulds were filled. The ramming was done in moderation, just sufficient to settle the concrete and bring mortar to the surface. The average time taken to mix a batch and fill moulds was 15 minutes. The concrete cubes are kept in a damp condition by being thoroughly wetted twice a day.

The proportions by weight used in mixing these concretes were calculated from the weights per cubic foot of the various ingredients. The weights per cubic foot of the ingredients were determined as follows:—The measure, which was a box with an inside measurement of 1 cubic foot, was filled half full of the material to be weighed and jolted four times; then filling it full, and after four more jolts it was struck off and weighed. In this method of measuring the cubic foot of material was not absolutely loose, nor was it by any means the most compact possible, but it gave me much more concordant results than weighing the material either loose or after shaking until it had reached its minimum volume.

The voids given were calculated from these measurements, the specific gravity of the stone being taken as 2.8, and that of the gravel 2.6.

As far as the tests have gone the concretes showed the following crushing strength in pounds for periods of ten and forty-five days respectively:—No. 1, 32,900 and 77,687; No. 2, 15,550 and 52,362; No. 5, 17,500 and 60,652; No. 7, 130,750 and 257,922; No. 8, 136,750 and 266,962; No. 11, 99,900 and 234,475.

The cubes were crushed parallel to the way they were packed into the moulds.

The ten-day cubes were crushed between sand beds. The crushing faces of the one-month cubes were carefully faced with plaster-of-paris twenty-four hours before testing.

### THE FORTIFICATION OF SCILLY.

VARIOUS rumours have been circulated at Penzance and Scilly since the Government announced their intention to spend a sum of money with a view to make the Isles of Scilly available as a naval coaling station. The position, however, appears to be a very simple one. The islands are now the property of the Duke of Cornwall, although for a great number of years they have not been administered by the Duchy authorities, but by

private leaseholders. A new lease was granted to the present lord proprietor, Mr. T. A. Dorrien-Smith, some three or four years ago. It is believed that the Government propose to purchase the freehold from the Duchy, and then to grant a new lease to Mr. Dorrien-Smith. The Government do not contemplate fortifying all the islands, the main object being to make Scilly a coaling station. For this purpose it is understood that the island of Stampson will be utilised and strongly fortified, and possibly masked batteries may be put on some of the other islands.

### SCOTTISH BUILDING TRADES FEDERATION.

THE half-yearly meeting of this Federation was held in Dundee on the 29th ult., Mr. John Adam, president, in the chair. Representatives were present from all parts of the country. The secretary (Mr. J. L. Selkirk, C.A., Glasgow) submitted the report of the executive on the work of the past six months, which bore that a number of additional local associations had been organised and that others were in progress. The movement had been hailed by employers as an important step in the direction of securing various urgent improvements in matters of vital interest to the building trades, and which could only be satisfactorily accomplished by a thorough combination on the part of those immediately concerned. The meeting had under consideration a draft form of contract, which was fully discussed, and thereafter remitted to the executive. The question of a suitable general mode of measuring, as well as of working by-laws, also engaged attention. Arrangements were made for stated reports on the condition of trade throughout the country being received and tabulated for circulation among all the local associations. Other matters of interest to the building trades falling within the scope of the Federation were afterwards dealt with, and satisfaction was expressed at the prospect of building trade questions being now taken up in a manner fitted to result in practical benefit to all concerned.

### SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on Monday evening, May 3, 1897, Mr. G. Maxwell Lawford, president, in the chair, a paper was read by Mr. Henry O'Connor (vice-president), entitled "Automatic Gas Station Governors."

The author first explained the need for the station governor in a gasworks, and pointed out that the pattern now in use and being manufactured by many firms was practically the same as that made fifty years ago. He then described the working and the method of finding the weights necessary for throwing certain pressures, and proceeded to explain the necessity of the parabolic form of cone. He then described the most notable of the suggestions made from time to time to improve the working of the governors, such as the double cone governor, the equilibrium single cone governor, the governor with a separate loading bell worked at a distance from the cone bell, water loaded governors, the double bell and cone equilibrium governor, the throttle valve governor, and governors with parallel side valves. The use of clockwork for the purpose of regulating the time of the loading and unloading of the bell was noticed, and also the loss due to uneven pressures. A new method of automatically loading governors according to the absolute requirements of the district was described, with details of several ways in which that might be carried out. The advantages of this system were pointed out, and a method of approximately registering the output of gas by the variations in pressure was suggested.

Before such an automatic apparatus could be put to work in a satisfactory manner upon any district, it would be necessary to make a series of tests of the pressures in various parts of the district, and also to examine carefully the capacity of the various pipes supplying that district, so that the point of minimum pressure might be previously determined. It would also be necessary to so regulate the pressures that the supply at that point would be at all times sufficient to supply the consumers, despite any calls which the mains between that point and the works might be called upon to supply. The author regretted that, owing to the death of a well-known gas engineer (Mr. Linton), the series of experiments intended to have been carried out during the recent winter have had to be postponed, which would otherwise have conclusively proved the advantages of this system when supplying a large district served by three distinct trunk mains worked by three governors, all fitted with this apparatus at one centre. Sufficient, however, has probably been said upon this subject to enable those interested in this important question to examine into the merits or otherwise of the system, and it is hoped that any of those present who may have any opinions either opposed to or in favour of the arrangement will state their views, so that, if possible, a further improvement may be made, and the general work of the gas

engineer rendered a little less arduous and worrying than it is at present.

### THE PROPOSED DRAINAGE BY-LAWS.

At a meeting of the Sanitary Inspectors' Association, held on Saturday at Carpenters' Hall, London Wall, a paper was read by Mr. W. H. Grigg (vice-chairman) on "The Proposed Drainage By-laws for the Metropolis." In the course of his paper, which was largely of a technical character, Mr. Grigg said that the necessity for a complete code of drainage by-laws for the Metropolis was obvious to everyone, and it was difficult to understand why it had not long ago forced itself on the authorities as a matter of extreme urgency, particularly when London's central authority had had the power to make by-laws since 1855, and had now prepared them under that Act. In commenting on the by-laws, he pointed out several respects in which he considered they required to be amended. There was no provision made for the submission of plans, sections and elevations of the proposed works to the local authority to be approved before commencing the works; the fall of drains was not specified; drains were not required to be true in invert and clear in bore; construction of piers for iron drains was not specified; inspection chambers were not made compulsory; there was no penalty for covering up work before it was approved by officers of the local authority; the supplying of water and filling of drains by the builder was not provided for, and the construction and maintenance of urinals was left out entirely. When sanitary inspectors served notices requiring certain specified works to be performed, unsympathetic owners frequently retorted, "Well, if I do all this work now, what guarantee have I that in a year's time you will not come again and condemn it all owing to some new fad, and require something else?" And when it was borne in mind that it was only on June 28, 1893, that the by-laws under the Public Health (London) Act, 1891, were issued, which differed materially from those now proposed by the London County Council, it was not surprising that such complaints should be made. Continuity in methods and requirements was a most desirable thing in this matter, and unless there was some absolute proof that the existing requirements were inadequate, it was earnestly to be hoped that the change would not be insisted on. There was nothing to show whether these by-laws were to supersede those under the Public Health (London) Act, 1891, or if they were both to

exist side by side. Many necessary things were provided for in the latter which were omitted from the new ones, and if they were to remain in force, in matters dealt with by both they must be made to agree. That the new by-laws had in them the elements of a great change there could be no doubt, but if they were not made to apply to repairs, &c., in old houses a great work yet remained to be done. A discussion followed.

### ALABASTINE.

"ALABASTINE," which is well known and appreciated throughout the United States as a material for colouring walls and wall decoration generally, has in this country hitherto not met with the recognition it deserves owing to no want of merit, but rather to the circumstances under which it was placed upon the English market. The inventor, Mr. M. B. Church, after protracted but successful litigation with the licensee, has secured fresh patents and established works in London for its manufacture, and is in a position to meet the large demands for it that are sure to be made when the advantages of its use become better known.

Alabastine is supplied in dry form, and is made ready for use by simply adding cold water, either for plain and permanent wall covering and decoration or for relief work, stippling, glazed tilework, &c. This, by doing away with the old laborious method of mixing the various ingredients, marks it as a great improvement; but there are many other advantages gained by its use, before referring to which it will be well to explain as to how it differs from other materials. The following extract from the report describes this:—

"The base of Alabastine is made from solid rock, which is ground and calcined, driving off the water of crystallisation by boiling in large kettles at great heat. This, when mixed with water, sets by taking up its water of crystallisation again, reforming a stone as hard as the original; this setting is retarded by admixtures, used in exact proportions, to hold it from setting long enough for the purpose without changing its texture or strength. This has been accomplished by years of experimenting and testing in actual work; and, more than this, the base in setting absorbs these admixtures, and the coat is porous and is therefore purified by air passing through.

"This base from which Alabastine is made, prepared as above described, is ground and mixed by a special process, polishing and separating the atomic crystals, and these are

tinted by automatic machinery, making the Alabastine tints as if they were ground from rock of their colour; and pure colours only are used, and not enough colour to hide the lustre of the crystals."

The result is that Alabastine is a cement that forms permanent coats, admitting recoating without removing its old coats, and hardening with age.

From a sanitary point of view Alabastine is deserving of attention. In buildings intended for habitation it can be used in place of paper, which is often the harbourer of disease and vermin, as it can be instantly cleaned and a fresh coat added. We have seen a specimen treated with thirty-five coats. The Michigan State Board of Health has given much attention to the subject of wall coatings and their relation to health. A paper read before them recommended the use of Alabastine, which they afterwards published, and at the World's Columbian Exposition they used it throughout the whole of the Michigan State buildings. In addition, a number of rooms in the fine arts section were decorated by it, as well as all the other walls of the main buildings where the walls had been plastered to receive decorative work, and that the highest diploma and medal were awarded is sufficient proof of its successful application. A most useful table is given by the company showing how forty tints can be made from three colours, setting out the proportions of each, which will prove a great help to the decorator. It is a splendid finish for new walls in place of a white coat of plaster, is done after the other work is finished and when the building is dry, and fills and hides the cracks.

Full particulars are given in the pamphlets issued by the Alabastine Company (British), Limited, from their works, Church Street, South Lambeth, London, S.W., which may be had on application. Amongst other important buildings on which Alabastine has been used are the New General Post Office, Polytechnic Institute of Chelsea, &c.

Jelstone made by this Company is an improved distemper, also ready for use by mixing in cold water, taking the place of whitening and size. It is easily removed when required to be renewed, and the Company guarantee that it gives satisfaction.

#### THE INSTITUTION OF CIVIL ENGINEERS.

It has been arranged to hold a conference of the members of the Institution in London this year under conditions which, it is hoped, will be convenient to many who are precluded from

attending the weekly meetings during the session, and may be serviceable to all by the discussion of a wider range of subjects than can be dealt with on ordinary occasions. It is intended that the business of the conference should differ from the ordinary proceedings of the Institution, papers descriptive of works executed giving place to brief statements concerning important debateable matters in engineering science and practice, introduced with a view to eliciting discussion on the questions raised. The conference is fixed for May 25, 26 and 27, the morning of each day (from 10.30 to 1.30) being devoted to the consideration of the statements referred to, and visits of inspection to engineering works being made in the afternoon. The work of the conference will be carried out under the direction of the council, with the assistance of seven sectional committees, consisting of members of the Institution representative of various localities in the United Kingdom and identified with the several branches of engineering. The sections are:—Railways, with Sir Benjamin Baker as chairman; harbours, docks and canals, Mr. Harrison Hayter, chairman; machinery and transmission of power, Sir Frederick Bramwell, chairman; mining and metallurgy, Mr. T. Forster Brown, chairman; shipbuilding, Sir William H. White, chairman; waterworks, sewerage and gasworks, Mr. Mansergh, chairman; and applications of electricity, Mr. W. H. Preece, C.B., chairman.

#### PAPYROLITH.

THE United States Consul in Zürich, Mr. E. Germain, has sent to his Government the following report on papyrolith:—A new material suitable for flooring, roofing, lining of water-closets, bath-rooms, walls, &c., was invented by Otto Kraner at Einsiedel, near Chemnitz, Saxony, about two years ago. The article did not, however, prove to possess sufficient resistance and consistency. Subsequently it was taken up and improved by Messrs. Braendli & Co., at Mainaustrasse No. 24, Zürich, Switzerland, who, by the addition of some chemicals have, as they claim, brought it to perfection and made it as durable as stone.

I called on the above firm to obtain what information I could, and from them learned the following:—

Papyrolith is a new kind of material, the principal ingredients of which are waste-paper and sawdust. These two substances are mixed with certain chemicals which, so far, are the exclusive secret of the manufacturers. The material is made into

## THE "SUNLIGHT" INCANDESCENT GAS BURNER.

PRICE FROM 5/3 COMPLETE.

Combines High Illuminating Power and Great Economy of Gas with a Soft Pleasant Light.  
THE NEAREST APPROACH TO SUNLIGHT. THE IDEAL LIGHT FOR DOMESTIC USE.

*The Mantles are the strongest in the Trade.*

"COSMO" BURNER Complete, as shown, 12-inch shade, 7/9 each.

Price List and Terms on Application

THE NEW INCANDESCENT (Sunlight Patent) GAS LIGHTING COMPANY, LIMITED,  
33 & 34 SHOE LANE, LONDON, E.C.

three separate bodies, viz. (1) a moist powder; (2) a dry powder, and (3) a liquid. These are then mixed in a proportion of 4 lbs. of moist powder with 6 lbs. of the dry one, and enough of the liquid substance is mixed therewith to bring the mass to the density of ordinary mortar. It is then spread over a foundation of wood or stone, as the case may be, in the same manner as asphaltum or cement, stamped down, levelled, left to dry and then polished. It requires at least two days to dry and harden.

This papyrolith, it is claimed, becomes as hard as stone, but without losing its elasticity, is perfectly water-tight, fireproof, a non-conductor of heat, cold, or sound; being spread into one solid mass it has no joints, is not porous, is non-adherent of dust or microbes, is noiseless and therefore especially recommended for flooring schoolhouses, hospitals, houses and public halls, water-closets and bath-rooms.

For roofing it is spread over a grooved or kind of corrugated roofing pasteboard especially manufactured for that purpose. It is lighter than other roofing material, weighing only 14 kilogrammes per square metre (about 26 lbs. per square yard), and requires therefore but a light wooden construction to support it; it is water-tight, a non-conductor of heat or cold, and what is more important, it is incombustible. It can be made in whatever colour desired.

As to its wear and durability, the article has not been in use long enough for experts to give an opinion; but contracting architects with whom I have talked on the subject believe that it possesses all the qualities the manufacturers claim for it.

The Zürich school authorities have had floors of this material laid in several of the city schoolhouses as a trial. In the Federal Museum an entire hallway is covered with it. Private individuals are contracting for it to line the walls of their bath-rooms, kitchens, &c., in place of tiling, formerly used for the same purpose, it being water-tight and less cold, and not so apt to crack under the changes of temperature.

The prices of papyrolith, laid down and ready for use, are, for the present, quoted at the following figures by the manufacturers (Braendli & Co.):—Floors with a layer of 0.591 inch thickness, about 1 dol. per square yard; floors with a layer of 0.985 inch, about 1 dol. 25 cents per square yard; roofing, 1 dol. per square yard; walls, 1 dol. 25 cents per square yard; special decorative work, as per agreement. Cost of manufacture is not obtainable.

No patent or application therefore has been obtained or applied for. The manufacturers state that none is obtainable

on an article of this kind, but as the chemicals or mixtures used in the preparation of papyrolith are only known to themselves, they feel safe against competitors.

### THE SURREY PAVILION.

THE report of the committee of the Surrey County Club deals at length with the question of the new lease of the Oval, which has been obtained for thirty-one years from Lady Day, 1896, from the Duchy of Cornwall at the increased rental of 750*l.* a year. By the terms of the lease the committee are under obligation to spend a sum of not less than 10,000*l.* in improvements and additions to the club buildings, subject to the approval of the Duchy. As was made known last season, the committee have determined to build a new pavilion on a considerably enlarged scale. The scheme will include the erection of a new tavern with every convenience for catering adequately for the vast numbers of people who attend the principal matches. For this purpose it may be requisite to borrow some money, and the committee propose to take powers to raise debentures to an extent not exceeding 10,000*l.*, and they ask the members of the club for their concurrence in this proposal. They point out that the payment of interest on any money borrowed and the repayment of the principal will undoubtedly increase the annual expenditure of the club, and they therefore propose that the annual subscription of all new members elected after May 1, 1897, shall be two guineas. They also ask for power, if necessary, to raise the subscription of all members to a sum not exceeding two guineas, but they trust it may not be necessary to exercise this power so far as existing members of the club are concerned. They further propose to raise the number of members to 4,000. The balance-sheet for last year shows an invested capital of 10,999*l.* 9*s.*, a sum of 1,000*l.* on deposit, and a sum of 133*l.* 4*s.* 7*d.* in cash in hand and at the bank. The balance of revenue account for the year ending December 31, 1896, was 1,803*l.* 14*s.* 8*d.*

### THE BLACKWALL TUNNEL.

THE formal opening of the Blackwall Tunnel by the Prince of Wales, as our readers are aware, has been fixed for Saturday, May 22. The contract to do this work for 871,000*l.* was signed at the end of 1891, and a practical commencement was made

PRICE LIST AND ESTIMATES ON APPLICATION

in March 1892. It has taken, therefore, just about five years. Few works of equal magnitude have ever been carried out in so short a time, says the *Daily News*, and no more signal success has ever been achieved in the engineering world. There has been nothing quite comparable to it in the way of subaqueous boring. The Severn Tunnel is much longer and looked to be much bolder. It is 4 miles and a half in length and it dips down right under the estuary of the Severn. The actual tunnel at Blackwall is but 4,465 feet, or about five-sixths of a mile. But the Severn Tunnel went down so deep that it left 45 feet of solid rock between its soffit and the estuary water overhead. At Blackwall there was but a space of 5 feet 6 inches between their boring and the 56 feet of water overhead at high tide, and that 5 feet 6 inches consisted of loose shingly gravel. The extreme length of the old Thames Tunnel works was but 1,300 feet, and it went 15 feet below the actual river bed. Yet they were twice drowned out there and several lives were lost; and between the commencement of the Thames Tunnel and its actual opening there was an interval of eighteen years. The total length of the Blackwall Tunnel works is 6,200 feet. The tunnel itself is 4,465 feet long, and of this length 1,220 feet is under the actual river bed and nearly 3,000 has had to be constructed by means of the compressed air system. The whole of it is now so far complete that it will certainly be ready for public opening by the date fixed for the ceremonial, the details of which have been for some time under consideration.

Approached from the south side, the first indications of the new connection between the two river banks are two new roads, broad and well made, and already studded by lamps and young plane trees. They are further embellished by the attractive and comfortable red brick cottages which, as required by Act of Parliament, the London County Council have set up for the accommodation of working people who have been displaced by the progress of the work. It is greatly to be wished that all the occupants of slum property throughout the metropolitan district could be similarly displaced and similarly rehoused. Of the two roads, one runs from East Greenwich and the other curves up from the direction of Woolwich. It branches out from the Woolwich Road, in fact, and the two highways join at a point half a mile or so from the entrance to the tunnel approach. The little colony of houses on the left-hand side of this joint road forms a particularly bright and pleasant feature in this rather prosaic expanse of marsh land and factories. They constitute quite a little model village round a central playground asphalted over and encircled with

a double row of trees, and provided with a "giant stride" for the enjoyment of the children.

The southern approach to the tunnel is through an archway close to the great gasholders of the South Metropolitan Gas Company. The arch forms a gauge for the height of the tunnel itself, so that any load that will pass beneath this entrance will have no difficulty in making the passage. From this point the road sweeps down between walls of white glazed bricks, with an incline rather less than that of the Haymarket, to the mouth of the tunnel. The tunnel face was to have been of white brick, like the walls that lead down to it, with just a rim of red granite round the entrance. This, however, had a somewhat paltry appearance. It is being altered, and the whole of the front at each end will be finished in red granite, which will have a decidedly more solid and imposing appearance. A flight of stone steps runs up from the tunnel mouth to the roadway above, thus giving easy access to foot-passengers.

The subway itself is now complete, the great semicircular arch, rising to a height of 17 feet, being entirely lined with white, and roadway and footpaths being ready for traffic. The arrangements for three rows of electric lamps are now being finished, and the whole length of the tunnel is completely lined with the white bricks or the glazed tiles, the fixing of which until quite recently rendered the whole of the central portion of the tunnel almost as busy a scene as it has been throughout. The tiles are from the works of Messrs. T. & R. Bōote of Burslem, and they have been brought in crates from which they had to be taken and sorted and dipped into water before being handed up to the workmen on the scaffolding. The tubs of water, the barricades of crates and heaps of straw and gleaming white tiles, and the large staff of workmen, all seen under the glare of the electric lights, afforded a very curious scene underneath the bed of the Thames and its 50 or 60 feet of water and all its shipping. All this, however, has been cleared out. The tunnel is practically finished from end to end, and the great shield which, under the gentle persuasion of eight-and-twenty hydraulic jacks, each pushing with a force of 150 tons, ate its way right through the bed of the river from shore to shore has had its centre knocked away. Its outer ring has, however, been embedded in the circumference of the tunnel, and remains a permanent memorial of this mode of tunnel construction, and of the greatest work of the kind ever carried out upon this system up to the present time. The busiest scenes in connection with the work are now to be found within the four great circular shafts, two of which

## THE "E. R. A." PHOTO BLOCK COMPANY,

City Office:—4 & 5 East Harding Street, Fetter Lane, E.C.

*Process Blocks of every description made from Drawings in Pen and Ink Line, or Wash, and Photographs, to print with type, on an entirely new method, giving greater value and effect to the picture, with strong definition of detail.*

*Our special treatment of Pencil Drawings is being largely adopted by Architects, Publishers, and Art Journals.*

For Particulars and Specimens apply to ALFRED FISH, Manager.

## THE SOUTHAMPTON STEAM JOINERY CO., BELVEDERE WORKS, SOUTHAMPTON.

London Office: 11 Clement's Inn, Strand, W.C. Estimates supplied.

Manufacturers of JOINERY suitable for all purposes, from the Cottage to the highest class of Mansion and Public Building.

**IN HARD OR SOFT WOODS.**

Church, Bank, Office, Shop, Ship, Yacht and other Fittings. School Seats and Desks. Chimney-pieces. Horticultural Buildings, &c.

**MOULDINGS. ELECTRIC LIGHT CABLE CASINGS AND COVERS.**

**STEAM SAWING, PLANING, AND MOULDING MILLS.**

Joinery and Fittings have been manufactured at these Works (which are the largest in the South of England) for some of the most important buildings in this Country and Abroad.

## PROUT'S CONTINENTAL SKETCHES

Proofs on Thick Plate Paper in Handsome Portfolio, Cloth, Gilt Lettered, Size 21 Inches by 15 Inches, Price 42s.

The work consists of 75 Plates, and was originally published at 30 Guineas. The Plates are the full size of Prout's Drawing and are an exact reproduction by the

**PERMANENT INK PHOTO PROCESS.**

MR. RUSKIN, referring to these Drawings, say:—"I have," says Mr. Ruskin, "both in my earlier books and in my lectures at Oxford, spoken of the sketches of Prout with reverence and enthusiasm."

"Prout ransacked every corner of France, Germany, the Netherlands and Italy."

"The sharpest photograph is not half so natural."

"His 'On the Grand Canal, Venice,' is an Arabian enchantment, his 'Street in Nuremberg' is a German fairy tale."

"Prout drew every lovely street in Europe."

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the

**PUBLISHER, P. A. GILBERT WOOD**

Office at "The Architect," 175 Strand, London, W.C.

will form huge wells for spiral staircases. The tunnel shoots right through all four of these vertical cylinders, and the work going on within them now is that of "junctioning up"—joining the horizontal tunnel with the vertical shaft, that is to say—and they were, long after the rest of the tunnel was complete, bewildering scenes of timber and machinery, bricks and pipes, and wires and steam-engines. There are two of these iron and concrete wells on each side of the river, one of which on the north, and one on the south, will be used for a staircase, giving the public access to the tunnel below from the roadway above. They will be domed over by glass roofs. The other two will not be open to the public, but will be reserved for necessary works or for ventilation.

The approach to the tunnel on the Kent shore, as has been said, commences at a point close to the South Metropolitan gasometers. Thence it plunges under the Ordnance Wharf and the bed of the river, Northumberland Wharf and the Blackwall branch of the Great Eastern Railway close to Poplar Station. From that point the work runs up to near the East India Dock gates, where there is another archway at the head of the slope. Both these archways are to have over them rooms to be occupied by the men employed at the tunnel. The open approach is quite finished, and the outer portion of the tunnel-face is here also being built in polished red granite. The most important work going on on this northern side the river is the erection of buildings for the installation of the electric light, including a chimney 120 feet high and about 12 feet square at the base. This part of the work has been in a somewhat backward state, but is proceeding rapidly, and the engines and dynamos are all ready for getting into position as soon as the building is sufficiently advanced. There is a considerable amount of work still remaining to be done in connection with this stupendous undertaking, but there is nothing that will present any such difficulty as will be likely to occasion delay, and there is no reason to doubt that all will be ready in due time. It has been a wonderfully successful piece of work throughout, and one remarkable fact has been the freedom from accident. Contrary to many forebodings, the loss of life has not been anything like so great as is usual with works of such magnitude. It was feared that many lives would be lost by the necessity for working in condensed air, and Sir John Hutton humanely secured the adoption of a scheme of compensation to wives and families of men so employed. One death has, unhappily, been attributed to this cause, and the widow and children have been duly provided for. Dr. Snell, who was resident on the works,

has left, and one of the County Council resident engineers, Mr. Hay, has also gone, leaving Mr. FitzMaurice to represent Mr. Binnie. Mr. Moir, who was engineer in charge for Messrs. Pearson & Sons, and who has really been the practical genius throughout this very heavy piece of work, has returned from a well-earned holiday abroad, after seeing the tunnel right through. Mr. Ernest Pearson has had charge during his absence.

### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

### APPLICATIONS FOR PATENTS.

- 9843. Nimrod Simmons, for "Improvements in flushing cisterns and water-waste preventers."
- 9844. James Whittaker and C. Whittaker & Co., Limited, for "Improvements in presses for bricks and like articles."
- 9893. William Frederick Wible, for "Improvements in combination locks."
- 9960. Charles Frederic Baker, for "Improvements in window blinds."
- 10021. Joseph Makinson, for "Improvements relating to pivotted window sashes."
- 10071. Oswald Kahnt, for "Improvements in or relating to the construction of plank floors."
- 10091. William Hewett, for "Improvements in apparatus for manufacturing tiles."
- 10099. Carl Fischer, for "Improvements in catches or fastenings for sash and folding windows and the like."
- 10147. Thomas Constantine Holford, for "Improvements in window-sash fasteners."
- 10219. Joseph Morton, for "An improved form of brick-tile or slab to be used in covering steam boilers."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

# THE NEW EXPANDED METAL

Meshes from  $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to  $\frac{1}{8}$ th in. thickness of steel.

**FOR BUILDING CONSTRUCTION**, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

**FOR SOLID PLASTER PARTITIONS**, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

**FOR FIREPROOF LATHING**, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

**FOR CONCRETE FLOORS WITH EXPANDED METAL**.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

**FOR EXTERIOR WALLS OF BUILDINGS**.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

**FOR FENCING, TREE GUARDS, WINDOW GUARDS**, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

**OTHER USES FOR EXPANDED METAL**.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

**BRASS, ALUMINIUM**, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

**CATALOGUES AND PRICE LISTS** can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

## THE EXPANDED METAL COMPANY, LTD.,

39 UPPER THAMES STREET, LONDON, E.C.

Telegraphic Address, "Distend, London."

Works—WEST HARTLEPOOL.

Telephone No. 1829.

# THE Architect and Contract Reporter.

## EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

## NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

*For Advertisement Scale, see page xiii.*

## COMPETITIONS OPEN.

BOOTLE.—July 31.—Competitive plans are invited of a technical school to be erected at the corner of Balliol Road and Pembroke Road, at a cost not exceeding 15,000*l*. Premiums of 50, 30 and 20 guineas will be awarded for the designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. J. H. Farmer, town clerk, Town Hall, Bootle.

MORECAMBE.—Competitive designs are invited for the erection of a new hotel, to be called the Hôtel Métropole, at a cost of 30,000*l*., at this picturesquely situated and rapidly increasing fashionable seaside resort. Designs must be sent in under motto on or before June 16, 1897.

## CONTRACTS OPEN.

ABERAMAN.—May 21.—For erection of thirty or more houses on Waun-y-Han-Ddwr, Aberaman. Mr. G. A. Treharne, architect, 27 Canon Street, Aberdare.

ABERDEEN.—May 18.—For erection of the Morison Wing, Scott's Hospital, Huntly. Mr. A. Marshall Mackenzie, architect, 1 Bon Accord Street, Aberdeen.

ALFORD.—May 21.—For erection of a house. Rev. M. Riggall, Malta House, Alford.

ALNWICK.—May 21.—For erection of a house, Swansfield Park Road. Mr. W. Robson Hindmarsh, jun., architect, Alnwick.

BACUP.—For alterations at the Thorn Inn and Butchers' Arms. Mr. Charles Parsons, architect, 9 Grimshaw Street, Burnley.

BATLEY.—May 20.—For erection of branch stores, house, reading and conversation-rooms in Purlwell Lane, Mount Pleasant. Mr. Jno. H. Brearley, architect, Hanover Street, Batley.

BIRKENHEAD.—May 17.—For erection of an additional wing to the Holt School of Science and Art, Leighton Road, Tranmere. Mr. Charles Brownridge, borough engineer and surveyor, Town Hall, Birkenhead.

BRIDGNORTH.—May 19.—For erection of a new mixed and infant school at Highley, near Bridgnorth. Messrs. R. Scrivener & Sons, Howard Place, Hanley.

BRIGHTHOUSE.—May 25.—For erection of an engine, boiler and press-house, chimney-shaft and other buildings, also for large sewage-tanks, subway and other works. Mr. A. M. Fowler, 1 St. Peter's Square, Manchester.

BUCHAREST.—May 18.—For construction of an industrial school at Jassy. Application to the Roumanian Ministry of Agriculture at Bucharest.

CARDIFF.—May 17.—For completion of St. Catherine's parish church. Mr. George E. Halliday, architect, 14 High Street, Cardiff.

CARDIFF.—May 17.—For erection of a branch free library at the docks. Mr. W. H. Dashwood Caple, architect, 1 St. John's Square, Cardiff.

T. P. ROBINSON, Wolverton, Bucks (accepted)	639	0	0

THE Shelley Road Mill, Preston, the property of Messrs. Hartley Bros., which was totally destroyed by fire on Sunday night, contained 46,000 spindles on forty pairs of mules, and the damage, which is covered by insurance, is estimated at over 40,000*l*. The cause of the outbreak is not definitely known, but up to six o'clock in the evening mechanics had been working in the topmost storey but one, and it was here, so it is stated, that the fire was first seen, shortly after eight o'clock. The building was one of five storeys, and was built in 1856. It was fitted throughout with patent automatic sprinklers, which, however, failed to prevent the fire getting such a hold that by the time the brigade arrived their task of saving the building was a hopeless one.

CATHEDRAL SERIES.—NORWICH: THE NAVE.—THE CHOIR.

## TRADE NOTES.

THE Huton Infirmary, Banbury, is being warmed and ventilated by means of Shorland's patent Manchester grates.

A HANDSOME stone reredos with marble and alabaster enrichments has just been erected in St. Mark's Church, Bath, to the design of Mr. S. J. G. Stone, architect, of 13 Orange Grove, Bath. The reredos has been carried out at Messrs. Jones & Willis's Works, Hornsey.

MESSRS. BERRY & CAMPBELL, warming and ventilating engineers, of 17 Ridge Road, Hornsey, N., have opened City offices and showrooms at 62 Watling Street, Queen Victoria Street, where they are exhibiting specimens of their improved radiators, hot-air and hot-water heaters, &c. They are prepared to estimate for warming and ventilating churches, schools, hospitals, manufactories, offices, and public and private buildings.

THE electric-light fittings of Mr. Beerbohm Tree's new and elegant theatre were supplied by Messrs. Höfler Raum & Co., of 25 Bartlett's Buildings, who have carried out this portion of the decorative scheme in a manner worthy of all praise. Among the pieces calling for special note are the large central chandelier in Louis XV. style in bronze, with rock crystals and sixty imitation candles; various smaller chandeliers, a large number of 3-light brackets after the famous wall lights by Cafieri in the Castle of Fontainebleau, beautiful hammered iron brackets in Italian Renaissance, from the design of Mr. Romaine-Walker, and the five iron braziers in Classic style between the columns of the façade.

THE Barkston Gardens Hotel, South Kensington, just opened under the management of Mr. John R. Roberts, has been furnished in substantial and artistic style by Messrs. Oetzmann & Co. of 62-79 Hampstead Road, N.W. The first impression upon entering the hotel is agreeable, and the impression deepens on inspection of the dining-room, which looks

cosy and warm in walnut and terra-cotta; the drawing-room in gold and white, with Chippendale furniture, Vernis Martin cabinets and a carpet of vieux rose ground and a rich floral design; the pretty bedrooms, in many of which Messrs. Oetzmann have introduced handsome Chippendale wardrobes and other articles of furniture; and the comfortable smoking and reading-rooms in saddlebags and warm colouring, and the daintily-equipped lounges. The billiard-room, ball-room and the bath-rooms call also for a word of commendation.

MESSRS. JEFFREY & CO., of Essex Road, N., have sent us some samples of their Royal Jubilee wall-paper, which they have designed expressly to commemorate the Diamond Jubilee. It consists of a wall-paper and frieze. The scale of the design is sufficiently large to make it appropriate for the decoration of public rooms and mansions, but the details are so full of interest that it is equally suited for rooms of more moderate size. The two large panels, which are the chief ornaments in the frieze, are emblematic of her Majesty's titles, the Queen of Great Britain and Empress of India, the Victorian Cross and the motto "Honi soit qui mal y pense" being introduced into the one, while the star of India, tiger, lotus, and the motto "Heaven's light our guide," form the other. Pendant from the ornamental foliage are two small panels representing the colonies, by "Commerce" and "Agriculture," while "Fishery" and "Manufacture" find appropriate emblems in the dolphin and the fly-wheel. The words "Annus jubileus." run under the central panel, and the notes of "God save the Queen" are introduced as the ornamental banding which divides frieze and filling. In the chief panel of the wall paper is introduced the British crown and lion, and the star of the Order of the Garter, supported by rose, shamrock and thistle, with its motto "tria juncta in uno," framed in by a broad soft banding in which the same emblems are entwined. Through this run ribbons with the words "Annus jubileus, 1897," and "Regina, uxor, mater, prestans." India is represented by the elephant, its architecture and the star of India; and closely bound into the one general design are panels representing the colonies—Australasia by the kangaroo, Canada by its wheat, South Africa by the ostrich, and other distant possessions by the ship and lighthouse. This design, which can be had in various colourings, has been selected for the decoration of the royal boxes at the Crystal Palace, and is likely to be extensively employed for that of the various structures which will be erected along the line of route of the Royal Procession, for which purpose it is eminently suitable.

# IMPORTANT TO ARCHITECTS

**BUILDING AND BUILDERS.**

THE Hampstead Guardians have resolved to apply to the Local Government Board for permission to borrow 15,000*l.* for the purpose of erecting the proposed additions to the Hampstead Workhouse, and, when permission is obtained, to borrow the money from the London County Council at 2½ per cent.

THE memorial-stones of a new Wesleyan Methodist chapel, to be erected at a cost of 2,250*l.*, were laid at Brightside, Sheffield, on the 6th inst.

THE memorial-stones of a new English Calvinistic Methodist chapel were laid at Rhosyllen, near Wrexham, on the 9th inst. It is to cost 1,200*l.* and to seat about 400 persons.

MEMORIAL-STONES in connection with an extension of the Wesleyan chapel and Sunday school at Marsden were laid on the 8th inst. The cost of the work will be about 2,000*l.*

WHILE a number of workmen were building a wall to the rear of Central Buildings, just erected in Main Street, Stonefield, Blantyre, about 25 feet of the wall fell, and three of the workmen were injured.

AT a meeting of the Liverpool watch committee a letter was read from the Local Government Board sanctioning the borrowing of 2,500*l.* by the Corporation to enable the committee to carry out the additions and alterations to the police station at Lark Lane, in order to meet the requirements arising from the extension of the city.

**ELECTRIC NOTES.**

THE Corporation of Hastings and St. Leonards have resolved to buy the Electric Light Works of the local company and carry them on as a town concern; 58,000*l.* is the price agreed upon, so that the shareholders will receive a premium of 15*s.* 8*d.* on each of their 10*l.* shares. The plant includes the mains, standards, &c., utilised in the lighting of the parades, which are three miles in extent. It is estimated that if the first year's business is only equal to that of 1896 the profit to the ratepayers, after the repayment of principal and interest on the loan which will have to be raised, will amount to 1,500*l.*, which is equivalent to a penny rate.

THE electric-lighting committee of Glasgow Corporation are considering three new sites for electric power and distribution stations, but have delayed making a final selection pending the receipt of a report from Professor Kennedy, the expert employed in connection with the proposed extensions.

**VARIETIES.**

LADY MEXBOROUGH has a private church at St. Raphael's, Kingston-on-Thames, which she keeps up at a cost of 500*l.* a year.

A NEW church, to be known as the Morison Memorial Evangelical Union Congregational church, was opened at Clyde Bank, Glasgow, on May 8.

A NEW Volunteer drill-hall for the Sandhurst Company of the Royal Berkshire Regiment at Camberley was opened on Wednesday by the Duchess of Connaught.

THE memorial-stone of Westminster College, the new home of the Theological College of the English Presbyterian Church, will be laid in Cambridge on the 25th inst.

ALTERATIONS and additions are being made to the general offices of the Lambeth Water Company, Mr. J. A. Gill Knight, of 21 Godliman Street, being the architect engaged. A tender for 4,135*l.* has been accepted.

A NEW volunteer drill hall for Paisley is to be built on the site of the old establishment at an estimated cost of 8,000*l.* The hall proper is a spacious apartment, 130 feet by 80 feet, and the building will also contain a reading-room, a billiard-room, committee-rooms, armoury and every convenience and accommodation for both officers and men.

AN appeal has just been issued on behalf of the restoration fund of St. Mary's Church, Birmingham. At present a good deal of the structure is in a crumbling state, and the necessary work will not cost less than 1,500*l.* The value of the living from all sources is only 220*l.* a year, and there is no repair fund.

THE new Queen's, at Crouch End, is to be opened on the August Bank Holiday. It will seat some 1,500 persons. Mr. Beerbohm Tree, it is stated, has promised, if he is in England at the time, to give an opening matinée, supported by Mrs. Tree and the company of Her Majesty's Theatre.

THE Crown Theatre in Peckham High Street will be a two-tier house, with a frontage of 146 feet. The dimensions of the auditorium are:—Height 48 feet, width 63 feet, depth 60 feet; and those of the stage, height to grid 64 feet, width 117 feet, depth 42 feet, proscenium opening 34 feet.

THE club-rooms of the Galashiels Liberal Club in Bank Street, which have been closed for some considerable time have been reopened after being improved and enlarged. The billiard-room has also been reconstructed and a new heating apparatus provided. The cost of the improvements is estimated at about 1,100*l.*

HIGH-CLASS DECORATORS,

ESTIMATES and DESIGNS for JUBILEE DECORATIONS submitted free of charge.

THE North-Eastern Railway Company have issued a neat guide containing particulars of farmhouse, hotel, seaside and country lodgings to be obtained during the holiday season, in Northumberland, Cumberland, Westmoreland, Durham and Yorkshire. The book contains a capital introduction describing all the principal tourist resorts in the North-Eastern district of England, as well as a number of well-executed illustrations of places of interest on the North-Eastern Railway.

THE Corporation of Brighton are about to offer a new issue of stock, amounting to upwards of 300,000*l.* Over 70,000*l.* of this will go for extensive and new machinery for the electric service, which has proved a most profitable undertaking, and another 60,000*l.* will be devoted to improving the water supply. These are the chief remunerative items. Not less important for the health of the town is the expenditure of 21,000*l.* on an improved sanatorium; 24,000*l.* go for altering the town hall, which has been outgrown by the great expansion of municipal work during the last twenty years or so; 18,000*l.* are allocated for the new technical institute now being built.

UNDER the title of *The London Argus* will be published, early in May, a penny weekly illustrated paper, exclusively devoted to the local concerns of the Metropolis. The new journal will deal comprehensively with the doings of the various public bodies engaged in municipal work, giving particular attention to the vestries and boards of guardians. It will also contain several interesting special features, including a weekly signed article by a leading public man on some question of current interest. In politics the paper will be uncompromisingly Unionist, and will be published by Messrs. J. S. Virtue & Co., Limited.

NEW police buildings are to be erected at Govan, N.B. They are to be situated in a new street to be called Russel Street. The buildings when completed will cover 3,055 square yards, and are estimated to cost about 11,000*l.* The new street will be 45 feet from the wall of the present buildings, and along the southern side there will be three tenements of houses for the accommodation of firemen and policemen. The fire station will be situated at the corner of Russel Street and Albert Street, and in close proximity there will be workshops, firemen's recreation-rooms, baths and stables. In the new block will also be the police muster-hall, sergeants'-room, &c. The court hall and magistrates'-rooms will be above the administrative department, as they now are, and underneath will be the chief constable's-room, lieutenants'-room and general offices. In an entirely new block there will be twenty-six cells, and the light-

ing department will be accommodated in a single-storey building overlooking a courtyard.

THE top stones of a monster chimney connected with the destructor and sludge-pressing machinery were on May 8 placed in position by Mr. Alderman C. Brierley (chairman of the Bury sewage committee, and the representative for Bury on the Mersey and Irwell joint committee) and Miss Dennis (daughter of the contractor for the chimney, Mr. C. Dennis, of Bury). There was a large gathering of members of the Bury Town Council and prominent residents in the borough, and considerable interest was evinced in the ceremony. About a dozen persons, including Mr. J. Kenyon, M.P., ascended to the top of the chimney, and when the stones had been declared well and truly laid loud cheers were raised, and success to the sewage works and the Bury Corporation was drunk. The chimney, it is said, will rank amongst the largest structures of the kind in the country. It measures 300 feet in height from the ground line, the diameter at the bottom being 28 feet 6 inches, and at the top 10 feet 4 inches. The foundation covers an area of 44 square feet, and is 18 feet below the ground line. The total weight of the structure, including the cast-iron cap and terra-cotta top, is 5,000 tons, which gives a pressure of 5,631 lbs. to each square foot of the foundation. About 200,000 bricks were used in the foundation, and 800,000 bricks in the whole structure. The cost is about 3,000*l.*

THE Scottish National Gallery in Edinburgh, which has been closed for nearly a twelvemonth, was reopened to the public on Monday last. Many alterations and improvements have been carried out in the interval. In the Galleries, as they have remained since 1859, the first room used to be devoted to portraiture, the second and third rooms to pictures of the English and Scottish schools, and the two last rooms to the old masters. Now the works are being arranged according to schools. In the first room are to be found the works of Dutch and Flemish painters, in the second those of the Italian and French masters, and in the other three the works of British artists. The sculpture has been very artistically arranged throughout the Galleries, and the bronzes and little marbles are shown in tasteful little ebonised cases placed at suitable intervals.

THE sea wall in front of the Grand Hotel at Lowestoft which was damaged by the gales in January, has been restored. The new concrete wall is strong and massive. The foundation is taken down 6 feet into the beach, and the structure is strengthened by iron piles driven to a depth of 17 feet.

FACTORY—346, 348, 350 EUSTON RD.,  
LONDON, N.W.

**THE INSTITUTION OF CIVIL ENGINEERS.**

A CONFERENCE of the members of the institution will be held in London this year under conditions which, it is hoped, may be convenient to many who are precluded from attending the weekly meetings during the session, and may prove serviceable to all by the discussion of a wider range of subjects than can be dealt with on ordinary occasions. It is intended that the business of the conference should differ from the ordinary proceedings of the institution, in that papers descriptive of works executed should give place to brief statements concerning important debatable matters in engineering science and practice, introduced with a view to elicit discussion on the questions raised. This conference is fixed to occupy May 25, 26 and 27, the morning of each day being devoted to the consideration of the above statements, and arrangements being made for inspections of engineering works in the afternoon. The work of the conference will be carried out under the direction of the council, with the assistance of seven sectional committees consisting of members of the institution representative of various localities in the United Kingdom and identified with the several branches of engineering. The sections are:—Railways, Sir Benjamin Baker, K.C.M.G., chairman. Harbours, Docks and Canals, Mr. Harrison Hayter, chairman. Machinery and Transmission of Power, Sir Frederick Bramwell, Bart., chairman. Mining and Metallurgy, Mr. T. Forster Brown, chairman. Shipbuilding, Sir William White, K.C.B., chairman. Waterworks, Sewerage and Gasworks, Mr. Mansergh, chairman. Applications of Electricity, Mr. W. H. Preece, C.B., chairman.

**NON-INFLAMMABLE WOOD.**

A VERY interesting demonstration of the practical value of an ingenious system of rendering wood incombustible was given on May 11 on the waste ground at the rear of the new British Art Gallery, now being erected on the site of Millbank Prison, in the presence of H.R.H. the Prince of Wales, who, accompanied by Prince Edward of Saxe-Weimar, watched the experiments with evident interest.

The experiments in question subjected the invention to an extremely severe test, and it is only fair to say that it came through the ordeal with the most perfect success. They were as follows:—Two pavilions, precisely alike in all details, were erected on the site above mentioned, one constructed of ordinary timber, and the other of timber rendered incombustible

by the new process. The dimensions of both buildings were identical, *i.e.* 11 feet square at the base and about 30 feet high to the top of the wooden chimney. The kinds of timber entering into the construction of both buildings were the same, *viz.* the frame and covering of pine, the interior finish of ash, oak, birch and mahogany.

Both buildings were attacked simultaneously by flames produced by setting fire to equal quantities of dry timber thoroughly saturated with petroleum (about four gallons to each pile) stacked against corresponding sides of the two buildings.

The fires were started at 12.45, and by 1.20 the untreated building was a heap of smouldering ashes, while that which had been treated was intact. An attempt was afterwards made to fire the latter by piling up dry timber, thoroughly saturated with petroleum, against its inside walls and setting fire thereto; but although the fire raged and roared until it had burnt itself out, the building was still unharmed, although of course scorched and blackened. An interesting feature at this stage was the taking out from the building of a box made of the treated wood, and containing souvenirs consisting of leather-bound booklets descriptive of the system. This box, which had been in the midst of the blazing heap, was found to be only slightly calcined on the outside, whilst its contents were absolutely unimpaired, in fact, they were not even warm, notwithstanding that the fire by which they had been encompassed had made itself unpleasantly felt at a distance of several yards.

From the booklet in question we make the following extract:—By means of this new process timber of all kinds can be rendered absolutely non-inflammable, *i.e.* incapable either of supporting or of conveying flame. Under the fiercest heat there occurs merely slow carbonisation of the part actually in contact with the flame. There is no spreading of flame by the treated wood, which is therefore practically fireproof. Nor is the process limited to timber of any particular size, but boards, planks, joists—in fact, timber of any dimensions can be treated with equal success.

The process, which has already been patented in nearly all countries of the world, consists of a series of careful manipulations whereby timber becomes uniformly impregnated throughout its entire bulk and texture with a fire-resisting compound which securely protects it from all danger of combustion. And this protection, too, is permanent, since the fireproofing substance with which the cells and tubes of the wood are impregnated is not affected by any change of climate or tempera-

ture ; in fact, age adds to the degree of firmness with which the fire-resisting crystals adhere in the cells of the wood. It should be stated, moreover, that the fire-treating compound is colourless, odourless and absolutely harmless to health. It does not attract moisture ; it does not discolour the wood ; it does not affect materially the working of the wood ; it merely adds a little to its weight. In general it may be stated that treated wood can scarcely be distinguished from non-treated wood.

There is no doubt that the patent is a valuable one and one that should be widely known. The tests to which it was subjected on Tuesday were very severe and were rendered more so by the strong wind which was blowing, but the preparation fully justified its inventor's belief in it. It has, moreover, made its *début* in England (its *pays natal* is America, where it is already well known and largely employed) under excellent auspices, as in addition to the Prince of Wales there were present the Lord Chancellor, the Austrian Ambassador, the United States Ambassador, Lord Tweedmouth, the Hon. R. B. Brett, Lord Londonderry, Lord Claud Hamilton, the Hon. Ivo Bligh, Sir Arthur Sullivan, Vice-Admiral Sir John Fisher, Sir Douglas Fox, General Russell, M.P., General D. Manuel de la Camara, Sir Edward Hamilton, Prince Blucher de Wahlstatt, Lord Portarlington, Baron Fersta, Sir Norman Pringle, Viscount Llandaff, Count Lavison, Mr. M. F. Williams, M.P., Mr. J. Penn, M.P., Mr. C. McLaren, M.P., Mr. R. G. Webster, M.P., and Mr. Sydney S. Gamble, of the Metropolitan Fire Brigade.

### ASBESTOS AND ASBESTIC.\*

WHEN the Canadian form of asbestos, which is technically named chrysolite, was first discovered, about a score of years ago, I had occasion to go over to Quebec to examine what, for all intents and purposes, was a new mineral, and report upon its qualifications and capabilities. I then became so impressed with its manifest importance that I determined to make a special study of it, as well as of asbestos generally.

My inquiries after, and searches for, asbestos have naturally led me into many remote and untravelling parts of the world ; and some few years ago I published a book on the subject, since which time, whenever any new discovery has been made, I am frequently sent for to advise on the special quality found,

\* From a paper by Mr. Robert H. Jones, read before the Society of Arts on April 28.

the best mode of working it, and the proper channels in which to dispose of its produce.

Asbestos in modern times was first brought into experimental use in Italy, and soon afterwards the United Asbestos Company, having acquired the Italian works and mines, started the manufacturing business in England.

It was not long afterwards that there appeared amongst us a totally distinct variety of the mineral, which had not long before been discovered in a wild and unpopulous part of the province of Quebec, in Lower Canada, and though it was not very favourably received at first, its economic value could not long be ignored, and experience has shown that while the two varieties are totally and curiously unlike, each has certain special uses and advantages, and indeed a combination of both is occasionally to be preferred to the use of either one of them separately.

The difference between the two forms of mineral is remarkable. The asbestos of Italy is asbestos properly so called. It is a variety of hornblende or pyroxene, while that of Canada is nothing more than serpentine, which occasionally, but only rarely, assumes a fibrous character. When it so occurs its mineralogical name is chrysolite. In form, structure and general appearance the two are as strangely dissimilar as any two minerals can possibly be ; yet in chemical composition they are remarkably alike, and in many of the uses to which they are put they may be said to be absolutely identical. Indeed, to such an extent is this the case, that by far the larger part of what is sold and used for asbestos is in reality chrysolite, which is so used and sold with full knowledge of the fact that it is so, and without any pretence of concealment or disguise whatever. The essential difference between the two is that Italian asbestos is anhydrous, while the Canadian chrysolite, being serpentine, is invariably hydrous, its water of composition amounting to between 13 and 14 per cent.

The first Italian mine was opened in Lombardy in 1866, and the first Canadian mine at Thetford, in Lower Canada, in that part of the country which is known as "The Eastern Townships of Quebec," about the year 1877. Some considerable time before this date the existence of the mineral there was known to geologists, and it was also exhibited at the International Exhibition in London as early as 1862, though at that time it was not much regarded, except by scientists, and by them chiefly as a mineralogical curiosity. But this first mine was no sooner opened, though its success at first was by no means promising, than others quickly followed, and prospecting

for fresh finds was extensively carried on in every part of the province.

I have here for your inspection a sample of the most useful of the Italian ores, with a specimen or two of Canadian ore from Thetford and East Broughton, so that you may see the strange mineralogical difference between the two species, also a sample of the Danville ore and fibre, with a lump of asbestic, which is the rock which carries the latter, and also a sample of the cleansed material, just as it falls from the cyclone, ready for use by the manufacturers. To these I would presently call your special attention in order that you may see in particular the wonderful nature of the rock itself, which is found at Danville. No lens is required, its very peculiar character being sufficiently obvious to the unaided eye.

In the Italian deposits one often finds minute crystals of green-coloured garnet, which the miners call the asbestos seeds (*semenze dell' amianto*). None of these are ever seen in the Canadian mines, but at Danville I have frequently found remarkable specimens of clear light-coloured translucent serpentine. I will show you a specimen of this, being part of a vein of pure silky fibre covered or protected by a rich delicate skin of a charming tint of light green as lovely as that of a newly-expanded willow-leaf in spring, yet this is in itself as clearly and compactly fibrous as that which is held compressed in the vein.

Well, what after all is asbestic? A dictionary will tell us that the word is an adjective, meaning something "of or belonging to asbestos;" but, as used here, it is a substantive, applying to that part of the rock which remains after the richer veins of asbestos have been extracted from it. This remainder is purely a fibrous material, which clearly shows its serpentine origin.

Now a few words on the particular uses of asbestic as apart from asbestos. The first idea which occurred to the discoverer was to pulverise it, and to convert it in its pulverised state into a cement or plaster. A few bags were sent to the manufacturing firm of H. W. Johns & Company for trial, when they found it to be so admirably adapted for this special purpose, and so unique from many points of view, that it was at once named "the king of wall-plasters." In its manufacture it requires the use of neither hair nor sand, its own fibres furnishing a perfect substitute for the former, and the pulverised rock supplying all that may be required of the latter. During the short time since its introduction, although the number of men employed in procuring it is unusually large, and the machinery

employed in its preparation entirely automatic, the supply is found to be unable to meet the demand. This plaster, being composed exclusively of asbestos, is both fireproof and a non-conductor of heat, so that a room plastered with it is not only protected from fire, but at the same time is kept warmer and more comfortable than if dressed with any other known plaster. It also effects a saving of something like 25 per cent. in the fuel employed; and being also a non-conductor of sound, bedrooms may be relied upon, if the spaces beneath the floors and over the ceilings be filled with rough asbestic, to be free from overhead or internal noises. Its use also is invaluable, for the same reason, in hospitals and sick rooms, as well as in music and concert-rooms. It is moreover odourless and vermin proof, and being a natural filter, if a pail be upset in the room above so that the underneath ceiling be wetted, it dries again as before and leaves no mark or stain. It is also as elastic as fibrous, so that there is no fear of any crumbling, chipping, fracture or displacement. Even if a nail be driven into it it will enter as readily as into a deal board. Neither the heat from any stoves or furnaces, nor even the "settling" of a building, will have any effect upon the asbestic. It will adhere to metal or glass, and I have seen it applied as a covering to a tin pipe, its adhesive nature preventing any crack or split when bent round the pipe; and when walls are papered or painted with it all danger from fire from that source is entirely avoided. When walls are plastered with it, no sooner does it become dry than all danger of having to do it again after the settlement of the building is entirely done away with.

I called at many of the huge buildings now rising about New York and Montreal, following the example of Chicago, and saw its practical use while building was going on. A coating of rough asbestic was first applied with a trowel, just as it would be with any other plaster, it might be on brick, laths, or plain boards; and, when this is dry, it forms a coating very much like the asbestos felt-board now so much in use in America and Canada. This rough coating is then surfaced over with a superior quality of asbestic called the "Finish," which dries with a fine appearance not unlike marble, and with a good polish. Its cost is about the same as that of good sand and lime plaster, which its covering capacity greatly exceeds, while its mixing is so simple, and its application so easy, that it is found to be practically cheaper.

There is a peculiar danger to be feared in all these lofty buildings, which are now so much the fashion over yonder, which specially arises from their framework. Both iron and

steel are so much affected by heat that, if a conflagration should occur near to one of these Babel-like buildings, the girders would become so affected that they would be likely to bend downwards, in doing which they would assuredly draw the uprights towards them, and cause a general collapse of the whole structure. I saw the action of this immediately after the destruction of the Tuileries and other large buildings in Paris in the time of the Commune. The plan adopted was to pile the furniture, and such other combustible matter as was at hand, in the centre of the principal room, pour petroleum over it and then set fire to the heap. The great heat soon caused the girders to sag downwards, drawing the sustaining walls inward, so as to cause speedy and irretrievable ruin. In the case of the monster buildings alluded to, if the metal skeleton were protected by brick, and the brick plastered with asbestic, all danger from the source indicated would be avoided. This is the plan adopted at the Waldorf Hotel in the Fifth Avenue, and many of the modern buildings in New York.

Asbestic is also applied, by the manufacturers already mentioned, to the making of a special roofing material of a perfectly light and cool character, which is so effectually proof against burning sparks and cinders that in every case of exposure to fire it has proved to be a complete protection. It is specially applied to the steep or flat roofs of factories, foundries, warehouses, railway buildings, cars, &c. It is suitable for all climates, has been used in every part of the States, and in parts of South America and Europe, for a sufficient length of time to show its superiority over corrugated-iron wherever used.

In 1861 the roofs of Kingsford's Oswego starch factory were covered with the original asbestos roof coating, which is still in good condition. This is now vastly improved in strength and durability by the use of asbestic, and specially improved asbestic roofing has now become so important, and in such rapidly increasing demand, that it is manufactured at the enormous rate of over two miles per day.

Mr. James Cunningham, of Montreal, said he was intimately acquainted with the Danville mines and deeply interested in the subject of asbestic. As Mr. Jones had told them, being composed of pure asbestos, a non-combustible material, asbestic was fireproof, in confirmation of which he would mention a test made in Washington at which he was present. Last year the United States Government, being desirous of securing a fireproof plaster for a new building being erected for the post-office, and asbestic being brought to their notice, determined to test it. A small structure was built and plastered with asbestic

half an inch thick, filled with firewood, and then a fire was lit and allowed to burn for half an hour; when, on the plaster still glowing from the intense heat, a stream of water from a 1½-inch nozzle was turned without having the slightest effect. A similar experiment had been recently made in Montreal with equally satisfactory results, and he hoped before long to see one in London. Mr. Jones said that asbestic, being fibrous, was elastic and was also a capital non-conductor of heat and sound, and would keep a house warm in winter and cool in summer, and all that he could vouch for. It had been his privilege from the inception of this discovery to visit the chief cities of the United States and Canada and interview the principal architects and builders; it was a radical innovation, and like all new materials, was quite justly subject to criticism and opposition, but he had invariably found a keen interest displayed, and wherever it had been specified and used, both architect and builder had been astounded at the work performed. Of the hundreds of buildings plastered with asbestic which he had reported upon, there was not one which had not borne out all that had been claimed for it. He had just returned from Glencoe, where Sir Donald A. Smith was building a mansion, and so thoroughly had he been convinced of the superior qualities of asbestic, that he insisted on the contract for parian being cancelled and asbestic used in its stead; and there, as everywhere else, all were astonished at its beauty, elasticity and strength. From the great success achieved in so short a time in the United States and Canada, he felt sure that in a year or two the demand would be very great indeed, and it was well that the supply was practically inexhaustible. One important feature was the impossibility of adulteration and consequently inferior work. Any architect specifying asbestic must get it and nothing else.

Captain Fox (London Salvage Corps) said that this substance appeared to be a most estimable article, well worthy the attention of architects and all interested in buildings. As he had listened to the paper he almost felt that his occupation was gone, for it seemed that even if a fire did break out it might be kept within reasonable limits by the use of this material. He did not say that it would reduce warehouse fires, but it would confine within reasonable limits fires which broke out in private houses. Besides, it seemed capable of thoroughly artistic treatment; the surface was most beautiful, taking a high polish, or it could be painted upon. He could certify to its fireproof qualities, having made a small experiment for his own satisfaction.

## LONDON COUNTY COUNCIL IMPROVEMENTS.

THE consideration of the Improvements Bill promoted by the London County Council came before the select committee of the House of Commons on Monday, the 10th inst. The purpose of the Bill was explained by Mr. Freeman, Q.C. It was, he said, to authorise the County Council to make four improvements at Chelsea, the Tower Bridge, the Strand and Tottenham Court Road. The first was to make a new embankment at Chelsea in connection with widening a part of Cheyne Walk. The present embankment abruptly terminated a few yards beyond Battersea Bridge, and it was proposed to carry it across the deep bay formed by the river until it reached the point on the bank where Lott's Road and Cremorne Road met, and where several large buildings extended into the river. This would enable Cheyne Walk, which was very narrow, and had a great deal of traffic along it, especially since the opening of Battersea Bridge, to be considerably widened. The foreshore between the line of embankment and Cheyne Walk at low water was a mud-bank. The medical officer of health to the local authority had frequently reported upon the insanitary state of this bit of the river, and the local authority was, therefore, very desirous to do away with it. The proposal of the Council was to fill the space between the embankment and Cheyne Walk with earth, and probably to form it into a pleasure. In order to meet a local fear that the Council might build on this space words were put in the Act expressly forbidding that. The total area of mud-bank intended to be salvaged was about  $3\frac{3}{4}$  acres. The Chelsea Vestry were so favourable to the scheme that they had taken the almost unprecedented course of agreeing to contribute one-fourth of the total cost. The only objection really to this scheme came from certain residents who were afraid that what was proposed by the County Council would interfere with the picturesqueness of this part of Chelsea. The Thames Conservancy were perfectly satisfied with the way in which it was proposed to carry out the work. The next improvement was that for making a northern approach to the Tower Bridge. The great difficulty was that at the north of the bridge, though the streets were very narrow and congested, they were passed over by exceedingly important railway work, which he believed was now used by the Blackwall Company, the Great Northern, the London and North-Western, the Tilbury and the Midland Companies. This locality could not be avoided in any scheme in this direction. The County Council, however, took the advice of the best engineers, and they were informed that the improvement could be carried out, but that it would take a long time, and that the cost would be great. The most beneficial street for carrying the traffic was one leading from the bridge by Little Tower Hill to Great Prescott Street, whence at a subsequent date it would probably be extended and form part of the scheme for getting to Whitechapel High Street. This street, as originally laid out, would have taken a large slice of the Royal Mint, which could only be done with the assent of the Office of Works; but he was glad to say that after discussion this matter had been satisfactorily arranged. As to the next improvement, it was perfectly well known to the committee that for a considerable number of years past a very prominent question had been the absolute necessity of obtaining a new street from Oxford Street or Holborn to the Strand, and there was a pretty general consensus of opinion that that street should pass into the Strand somewhere near Waterloo Bridge. Up to the present time enormous difficulties had intervened, partly physical and partly financial. In addition to the fact that such a scheme would involve considerable engineering work and enormous expense connected with theatres and other large buildings, there was the fact that there were very large areas of insanitary and bad property to the rear of the Strand and Wellington Street which, before carrying out the great scheme, it was thought should be dealt with under the Artisans' Act. The present proposal, which was rather an instalment, was to sweep away the whole of the island of houses between the churches of St. Mary-le-Strand and St. Clement Danes, and between Holywell Street on the north and the Strand on the south. The present was a very fitting time to carry it out, for it so happened that most of the leases of that island of houses were now falling in, and if they were to be purchased it was very desirable that they should be purchased before new interests were created. The last of the improvements was of similar character, but related to the island of houses at the corner of Tottenham Court Road and Oxford Street, known as Bolter's Court, which formed an exceedingly objectionable block to traffic and which could be very easily dispensed with. The road was very narrow there, and there seemed to be no question that it would be an exceedingly desirable thing that the island should be removed, the only point being who should pay for it. After discussion with the local authorities the County Council came to the conclusion that they would be justified in effecting the improvement and in charging it upon the metropolitan rates. Counsel proceeded to explain to the committee the part of the Bill relating to the raising of a large portion of the cost by

what was generally known as the betterment clause, which applied to all four improvements. He went on to trace at great length the history of the introduction of this principle into Parliament. He read the report of Lord Halsbury's committee on the subject, and directed attention to the provisions of the present Bill relating to the procedure for putting the betterment principle into force, which, he said, were identical with those of the Southern Approach Act of 1895. One feature which he emphasised was the fact that the onus of proof was on the persons seeking to impose the charge. When the charge was imposed, power was taken to enable it to be redeemed by payment of a sum equal to thirty-three times the amount of such charge. He also pointed out that, although a property might be included in the betterment area, it did not necessarily follow that it would be subject to the charge. If it were found that it was not improved the property would not be charged. Only one-half of the benefit supposed to come to the property was to be intercepted—thus, if a house were improved 50 per cent. the County Council would only seek to charge 25 per cent. of the improvement upon the property, and they would collect it at the rate of 3 per cent. per annum. The arrangement came to with regard to Crown property was that where it belonged to the Crown, and was let by them, the betterment principle should not apply, but that where the property was actually used, as well as owned, by the Government it should. In conclusion, he dealt with the various petitions against the Bill which had been presented.

Mr. A. R. Binnie, engineer to the County Council, said the foreshore where it was proposed to place the embankment consisted of mud, which was always dirty, not to say disgusting, and being in a kind of bay was not subject to the scour of the tide. Very frequently an unpleasant smell arose. Of the  $3\frac{3}{4}$  acres that would be reclaimed about 66 per cent. consisted of mud-bank. Under the present proposals the roadway at Cheyne Walk would be widened from 26 feet at some places to not less than 60 feet. The embankment would be of concrete, faced with granite, and it had been designed with a view to further extension if necessary. Granite was most durable, and, in the long run, would be the cheapest material to use. His estimate of the cost was 38,000*l*.

## THE IRON AND STEEL INSTITUTE.

AT the first sitting of the twenty-eighth annual meeting of the Iron and Steel Institute of Great Britain on Tuesday, the 11th inst., in the lecture theatre of the Institution of Civil Engineers, Westminster, Mr. Edward Pritchard Marten delivered his inaugural address. He first referred to the Diamond Jubilee of the Queen. Drawing upon his past and present experience, he proceeded to show the great progress that had been made under difficulties in every department of iron and steel manufacture during the past 100 years. From the earliest records of iron-making in South Wales it appears that in 1791 the quantity of coal consumed per ton of pig iron at Dowlais averaged 8 tons 1 cwt., whilst the average make of pig iron per furnace per week was 20 tons. Tracing the increase of output and the reduction of fuel at intervals through successive periods, the President stated that in 1896 the maximum makes of blast furnaces had increased to upwards of 1,600 tons per week, with a consumption of coke of about 19 cwt., equal to about  $1\frac{1}{2}$  ton of coal per ton of pig. The enormous advances which have been made in the manufacture of iron and steel were noticed by the President, who especially alluded to the inventions of Bessemer and Siemens, which had done so much to develop the steel industry. As an example of the rapidity with which steel can now be produced, he stated that at the Dowlais-Cardiff works iron ore can be discharged from the docks, passed through the blast furnaces, the pig iron made and treated by the Siemens process, and rolled into steel plates within forty-eight hours. The make of pig iron in 1896 was 8,563,209 tons, being the largest quantity ever produced in this country in a single year. The production of steel in the same year was 4,133,397 tons, of which 1,815,842 tons were Bessemer and 2,317,555 Siemens steel. The output of steel rails in 1896 was 847,534 tons, being an increase of 213,396 tons on the previous year. The make of manufactured iron in the same year was 1,198,584 tons, being an increase of 50,572 tons upon 1895. Whilst congratulating British manufacturers upon these statistics, the President, from personal observation, complimented our continental competitors on the great progress they were still making in iron and steel manufacture. The advanced competition of America with Europe was referred to at considerable length, the enormous outputs of the leading American steelworks being given. With regard to the tinplate industry, the President observed that it had recently suffered from American competition, and had thus practically lost its best market. He hoped, however, that the ever-increasing demand for tinplates by other countries would restore it to something approaching its former prosperity. New uses for steel were being sought, but in this country little progress was being made as compared with the progress of the United States. There it

was utilised in the construction of large buildings. In Chicago the steel skeleton of a building thirteen storeys high was erected in twenty-five days. The hotel built for Mr. John Jacob Astor in New York had sixteen storeys, all the main structural work being of steel, of which material the building contains 10,000 tons. Another large building in Park Row has thirty storeys, utilising 9,000 tons of steel. Wages and labour cost were discussed, the President observing that in steel manufacture the introduction of appliances for dealing with heavy masses of metal which could not be handled by manual labour had tended more than anything else to reduce labour cost. Turning to railway rates, the President referred to the very low rates charged in the United States as compared with those prevailing in Germany and Belgium, and more particularly in our own country. He dwelt, amid applause, upon the vital importance to the iron and steel industry of a reduction in the cost of transport, pointing out that if we could obtain low rates of freight similar to those current in America, or even in Belgium and Germany, there was no country in the world where materials for iron and steel making could be assembled more cheaply than Great Britain. In conclusion, the President referred to strikes and labour disputes which caused enormous loss to both sides. Heartily concurring with Sir David Dale, who in his inaugural address said, "Neither capital nor labour can afford to do anything which tends to hamper that cordial co-operation by which alone the well-being of the community can be secured," the President added, "Whoever discovers a means by which disputes can be fairly and honestly settled will deserve well of his country and of the world at large."

At the conclusion of the address a vote of thanks was accorded to the President on the motion of Mr. E. Windsor Richards, seconded by Sir Lowthian Bell.

### STEEL CAISSONS FOR FOUNDATIONS.\*

In the case of the Manhattan Life Building in New York—the first of the very high office buildings where the caisson method was resorted to—the architects, Messrs. Kimball & Thompson, found that enough piles could not be driven in the lot to properly support the loads, and that to float the building on grillages was out of the question, because of the danger that the soft material beneath would escape laterally under its great load. To make open excavations to the bed-rock, some 54 feet beneath the street surface, was not safe, if possible, because of the danger of undermining adjacent buildings. To obviate all this, it was decided to sink steel caissons by the pneumatic process, as is done in obtaining foundations for most of the great bridges. Thus was inaugurated, four years ago, the caisson method now coming into extensive use for buildings.

A pneumatic caisson is simply a diving-bell, on top of which the pier or foundation structure is built. It consists usually of a rectangular or round box made of boiler-plate steel. It is 7 or 8 feet high and without bottom, and of length and breadth in accordance with the size of foundation pier required. After being set in position on the lot, the construction of the brick or concrete pier upon its roof is commenced. A passage-way through this latter and the roof of the caisson is provided by means of an iron tube, usually 3 feet in diameter. This is closed by means of an immense double valve, or air-lock. Men enter the caisson beneath the pier and commence undermining it, the material being hoisted out through the tube. When the water-level is reached and the excavators are troubled by the gradual entrance of the water into the working-chamber of the caisson, air is blown in through a pipe. This air is supplied by powerful steam air-pumps, and its pressure holds the water down to a level with the bottom or cutting-edge of the caisson. The men and the excavated material can pass through the tube without relieving the air-pressure, because the air-lock has two doors, only one being opened at a time, and the pressure between them being regulated slowly to avoid injury to the workman by the sudden transition to or from the compressed air.

The operation of undermining the caisson and building upon it is continued until the cutting-edge reaches bed-rock. This latter is then cleaned, and, if sloping, is stepped off; then the entire chamber is filled solidly with concrete. The pier then consists, first, of the concrete base or filling of the caisson surrounded by the walls of the working-chamber; next, above this, and forming part of the permanent work, the metal roof, a fraction of an inch thick, of the caisson; and, above this, the pier proper, of brick or concrete.

The speed of building foundations in this way is much increased by the fact that, while the excavation is being made, the pier itself is being built, so that it is actually finished within a few hours after the excavation is completed. The weight of the masonry and metal, and additional temporary load when

needed, force the caisson down against the upward pressure of the air against its roof, and, when properly conducted, the sinking results simply in pressing an immense plug into a passage-way cut for it through the earth to the bed-rock, thus permitting no flow of material into the excavation to endanger the support of the adjacent buildings.

The cellar floors of the new buildings are almost invariably placed at a lower level than the foundations of the older buildings adjoining, and for this reason, if for no other, it has been the custom to shore the adjoining building. The favourite method of doing this now is to cut notches in the wall, and in these to sink pipes built up of sections screwed on as sunk, taking the weight of the building on these pipes. In the case of the great building about to be put up facing Trinity Church at Broadway and Rector Street, the adjoining building is being thus supported before the buildings to be torn down are removed. Some very valuable time will be saved in this way. The work is done from the basement of the building to be removed, without disturbance to anyone, by cutting openings through the walls of the building to be removed and opposite to each of the notches in which pipes are being sunk under the adjoining building. In some cases it may prove economical and entirely feasible to build the foundations for a new building before removing the old buildings. When tenants of the old building cannot be induced to give up their leases on reasonable terms before the end of the regular term—in New York on May 1—such a procedure might enable a new building to be completed by the beginning of the next rental year.

The time required now to build the foundations for a large building by the caisson method is from two to three months, but this time will doubtless be lessened with increased experience.

Cylinders within which to build foundation-piers for buildings have been sunk without the use of compressed air, by simply loading them and easing up the friction and resistance by jets of water. This method has very great limitations, and because of the liability of endangering near-by buildings by disturbance of the material and of the uncertainty of getting the cylinders to the proper position and depth, so that they can be cleaned out and the foundation well built, the method seems likely to be used only when the conditions are particularly adapted to it.

It is probable that in some cases, rather than sink isolated caissons, or rows of them, it would be better to sink one or more caissons to cover the entire lot, not filling these with masonry, but using them merely as shells or coffer-dams, by which the exterior walls of the building and its columns could be carried downward to the rock and the entire space utilised for storeys below ground. The walls of the caissons may become the walls of the building, in part or wholly, and its roof may be one of the floors. With ample fresh air brought by flues from the roof of the building; with white tile finish and electric light; with absence of the usual basement masses of masonry, since the columns themselves would be carried down, and with the elevators running down to them—I believe that for safety-vaults, restaurants, barber shops, &c., the rental of such storeys would, on the most valuable sites, pay a fair return on the cost of the entire foundations. In this craze for high building, when we contemplate the possibilities of having ere long to go to the country or the roof to find out if the sun shines, is it not time to make this plea for additional depth rather than increased height?

It is the great misfortune of the substructure engineer that his work is not in evidence. He may build well, but he must bury his work, and unless the space be utilised as just suggested, the money he spends brings no apparent revenue. Hence, doubtless, the hesitation of many owners to go to the expense of supporting their buildings on a rigid foundation, and yet the cost of this, as compared with that of the cheapest possible foundation, generally would not exceed it by 5 per cent., and seldom, if ever, by 10 per cent., of the cost of the building. To offset this there would be in most cases reduced cost of repairs from cracking of plaster, settlements, &c., a longer life of the structure, and in New York city the consequently higher rental value. In an advertisement of the highest office building in the city it was lately set forth in large type that the building stands on solid bed-rock, whereas in reality it is floated on fine sand, and has been provided with an ingenious arrangement by which any of its columns can be lifted and shimmed up by means of hydraulic jacks inserted in the pedestals beneath the columns.

The investor who builds a great building to-day must bear in mind that we cannot expect these twenty-storey buildings to be outgrown in a few years, as the four or five-storey buildings have been. They should be built to last; the steel and wood, when hidden, should be protected from decay; and the metal and masonry should not be overstrained. He should also remember what the value of the structure may be ten, twenty, or thirty years hence; and what its reputation is likely to be in the light of that day's knowledge of high buildings.

\* From an article by Mr. Charles SooySmith in the *Engineering Magazine*.

A structure just finished may have defects which seem of little commercial consequence now, because serious consequences from them are twenty, thirty, or forty years off. Ten or twenty years hence they may be visibly impending. As yet there have been no disasters or conspicuous failures of any of the finished high buildings; doubtless in the main they have been too well built for us to anticipate any; and, happily for static conditions, the factors of safety have very large margins. Yet it is more than possible that some one or few, through faulty design or careless or dishonest construction, may fail; and, whether the particular imperfection causing the failure be quicksand under the building, rust or overstrain of some of its members, or something else, the value of every structure having the same possibility will be materially affected. If a single one of the prominent new buildings on a floating foundation were to threaten to give way, the selling value of every large structure in the city on a similar foundation would decrease to an extent far greater than the sum it would have cost originally to support it on a trustworthy stratum.

This plea for the building of the best foundations is made to owners, who are the ones who need to be reminded of their interest in them. The architect will, as a rule, be only too glad to have them, but he is generally under injunctions of economy, and, unless encouraged by a proper attitude on the part of the owner, will often hesitate to urge the outlay necessary to provide foundations in keeping with the weight and cost of his building.

As the statutes now stand in New York city, the builder of a new edifice has to protect from settlement the adjoining buildings, when the latter have foundations more than 10 feet below the street level. This has been fair enough in the past, but during the last few years many very heavy buildings have been erected on shallow foundations with fine sand, in some places practically quicksand, beneath them. This has been put under so great pressure, and under such a tendency to seek lateral escape, that the owner of an adjoining lot, when he wishes to build, must either limit himself to a shallow foundation, which may mean a permanent improvement inadequate to the site, or meet the risk and heavy cost of protecting, by underpinning or otherwise, his neighbour's building. The law should be amended; either the excessive overloading of the soil at slight depths should be prohibited or the adjoining owners should be relieved from liability for settlements caused in carrying out with reasonable care the excavations necessary in improving their property.

The evolution of the new type of business buildings has been startlingly rapid. Probably the further advances to be made will not be in the direction of greater height, but in that of improved structural character and true economy of design. That greater attention to the matter of foundations is now a marked feature is shown by the fact that, of the six high office-buildings to be built in the coming season in lower Broadway, four are to have caisson foundations sunk to the rock by the pneumatic process, and foundations of the same kind are to be used in the new custom-house in Chicago.

### IMPROVEMENTS AT ROUEN.

THE British Consul at Rouen, in his last report to Lord Salisbury, says:—

The new quays, of which I reported the near completion in my last report, were placed last year at the service of shipping, making in all 441 metres (1,470 feet) of additional quay room, of which 252 metres are on the right and 189 metres on the left bank. The rails of the Northern Company have been extended upon the right bank, and those of the Western Company upon the left bank over these quays and the Chamber of Commerce has prolonged over the same quays the rails of their hydraulic and steam derricks. The new quay upon the northern bank will be lighted by electricity during the present year.

The junction of the termini at Rouen of the Western and Orleans lines of railways is approaching completion. I have in a previous report fully described the importance of this work to the commerce of Rouen. West Central France will then be in direct communication, through Rouen, with North Eastern, and the direct despatch of goods from one to the other will be greatly facilitated. The connection is made by a viaduct running through the populous quarter of St. Sever. The sandy nature of the soil, and the fact that water was reached a few feet below the surface, made the laying of the foundations a costly work, but all the pillars, which are of stone faced with granite, are now finished, and are ready for the placing of the girders on which the rails will run. The erection of the new goods station behind the Orleans terminus proceeds concurrently with this work, and when it is completed the service of despatching goods by rail that are discharged on the south quays will be much quickened. The delays in the clearance of goods from the south quays have lately caused much complaint

from traders, and a great improvement is looked for from these works. The cost of the viaduct is about 160,000/.

There is another work just commenced, which I may describe, for it will form a most prominent feature in the harbour, and will be of great use to all frequenting the port who have business to do on both sides of the river. It is also of interest as the first of its kind in France, and I do not think anything like it has yet been constructed in the United Kingdom. It is called a "Pont Transbordeur," and it will serve every purpose of a third bridge over the Seine three-quarters of a mile below the lowest existing one, but its special feature is that it will not interfere in any way with the free passage of ships, even of those with masts 150 feet high. I shall perhaps give the best general idea of its appearance by saying that two diminutive Eiffel towers are to be erected, one on each river bank, and that a narrow iron bridge will be suspended by chain cables between their heads. This bridge, which will be not less than 160 feet above the level of the quays, is not, however, intended for the passage of carriages or even foot passengers. Several lines of rail will be carried along it, and upon these lines a skeleton carriage or platform on wheels will run. This will be dragged from side to side of the river by steel ropes passing over a driving-wheel, to be worked by a steam or electric engine upon one of the banks. To the skeleton platform will be hung by steel hawsers, at the level of the quays or 160 feet below the bridge, the "Transbordeur." The "Transbordeur" is the slung carriage within which passengers and carriages will be transported from one bank to the other. It will be of solid construction, and not less than 13 metres in width by 10 metres in length. As by the time the "Pont Transbordeur" is completed the electric tramways will be running on the south quays of the river, as well as on the northern, it is intended to make a connection between the lines at this point, and the "Transbordeur" will be fitted to carry the tramcars, so that passengers by them will cross the river without changing their seats. I believe that over only one other river in Europe a similar mode of transport has been adopted, that is over the Nièvrion a little distance below Bilbao. Unlike most such works in France this has been left to private enterprise, and it will be carried out by M. Arnodin, of Châteauneuf-sur-Loire, who is also the patentee. It will cost the Municipality of Rouen nothing, but they grant the concessionaire a monopoly for eighty years of the bridge traffic over the Seine at this point according to a very moderate pre-arranged tariff. Foot passengers are charged only 5 c. ;

animals, 5 to 10 c. ; carriages, from 10 to 25 c. ; and a tramcar, not weighing more than 5 tons, will be carried from bank to bank for 1 fr. The work is already commenced, and the outside time allowed for its execution is eighteen months. It will bridge the Seine at the foot of the Boulevard Coudreau.

## PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

### APPLICATIONS FOR PATENTS.

10287. Conrad Lash, for "Improvements in edges for asphalt and similar roofs."

10301. Robert Ewing, for "Improvements in the joints of earthenware and other pipes."

10329. Edward Martin, for "Improvements in or relating to gully traps and the like."

10374. Charles Hammon Davies, for "Improvements in hinges."

10409. George Jabez Beedham, for "New or improved taper spring wedge or door stop for holding doors in any required position."

10438. James Crum-Kahle, for "Improvements in and connected with window-sashes and frames."

10479. William Godfrey, for "Improvements in sewer traps for waste pipes and the like."

10493. Robert Armitage and John William Colt, for "Improvements in kilns and apparatus to be used in the manufacture of bricks and other articles."

10610. William Henry Walfer, for "Improvements in wedges to prevent the rattling of sashes."

10626. Mathieu Vhigen, for "Improvements in and relating to flushing apparatus."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

# THE NEW EXPANDED METAL

Meshes from  $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to  $\frac{3}{16}$ th in. thickness of steel.

**FOR BUILDING CONSTRUCTION**, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

**FOR SOLID PLASTER PARTITIONS**, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

**FOR FIREPROOF LATHING**, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

**FOR CONCRETE FLOORS WITH EXPANDED METAL**.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

**FOR EXTERIOR WALLS OF BUILDINGS**.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

**FOR FENCING, TREE GUARDS, WINDOW GUARDS**, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

**OTHER USES FOR EXPANDED METAL**.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

**BRASS, ALUMINIUM**, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

**CATALOGUES AND PRICE LISTS** can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

**THE EXPANDED METAL COMPANY, LTD.,**

**39 UPPER THAMES STREET, LONDON, E.C.**

Telegraphic Address, "Distend, London."

Architect and Contract Reporter.

## EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

## NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

*For Advertisement Scale, see page xv.*

## COMPETITIONS OPEN.

BOOTLE.—July 31.—Competitive plans are invited of a technical school to be erected at the corner of Balliol Road and Pembroke Road, at a cost not exceeding 15,000l. Premiums of 50, 30 and 20 guineas will be awarded for the designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. J. H. Farmer, town clerk, Town Hall, Bootle.

MORECAMBE.—Competitive designs are invited for the erection of a new hotel, to be called the Hôtel Métropole, at a cost of 30,000l., at this picturesquely situated and rapidly increasing fashionable seaside resort. Designs must be sent in under motto on or before June 16, 1897.

## CORRESPONDENCE.

## Exits from Buildings.

SIR,—Is not foolhardiness a virtue in the eyes of Englishmen? My reason for troubling you with this letter is chiefly to get a reply to this question. I notice that notwithstanding the most awful disasters and panics—as for instance, that at Paris in the early part of this month—English folk continue to frequent churches, theatres, and in fact every description of place of amusement and of worship in the most approved happy-go-lucky style. Look at theatres, for instance. Which of them provides ample exits in case of fire or panic? Does the Opéra Comique? Does the Criterion? With regard to churches, which of these sacred edifices is provided with at least three exits per side wall with one exit at the western end? I know of none. I know of plenty of theatres where there is a single staircase leading to the dress circle, another solitary staircase to the gallery and so on. I know of plenty of theatres where the occupants of the stalls, dress and upper circles come down (possibly) separate staircases all converging into one corridor, which certainly is provided with swing doors opening out on to the street; but what would be the result in case of a panic? Turning to churches, I know of any number unprovided with swing doors, any number reckoned to seat 1,500 worshippers with one solitary door at the western end or possibly with only two doors—both extremely narrow—facing each other; and I have before me a catalogue of an enterprising firm of iron-church builders whose extremely elegant plans are certainly not assuring so far as the bodily safety of worshippers is concerned, though perhaps their spiritual safety was all that the firm in question thought of.

And yet this state of things is allowed to pass unheeded and uncared for. Architects go on constructing and planning edifices that repel one with horror as the thought of a panic rises to one's mind on contemplating these designs. Worshippers and theatre-goers all frequent their respective rendezvous without taking so much as an iota of thought at the possibility of danger, and the county councillors of our land read of horrors such as this century has amply begotten at theatres and bazaars, and yet allow the possibility of their recurrence to continue.

Speaking for myself, I have for long given up attendance at church on Sundays and other holy days—though not at other times—merely because I see for myself how utterly indifferent my spiritual pastors and masters are to my bodily

welfare; and as to other public rendezvous—well, I have not set foot in one for years, merely because I see how utterly indifferent the authorities are for the safety of persons there assembled.

Perhaps some county councillor may see this letter—and you kindly print it—and inform me whether foolhardiness is not a virtue, and one which all county councillors should encourage.—Yours faithfully,

HENRY CUNLIFFE.

Hove Club, Hove: May 17, 1897.

## TRADE NOTE.

ST. MICHAEL'S SCHOOL, Bristol, is being warmed and ventilated by means of Shorland's patent Manchester grates.

## VARIETIES.

MR. JAMES STIFF, of the London Pottery, Lambeth, died at Swanage on the 18th inst. in his eighty-ninth year.

AN English Presbyterian church, capable of seating 250, was opened on the 13th inst. at Saltney Ferry.

A NEW Board school at Walworth, which is to be known as the Michael Faraday School, was opened on the 13th inst.

THE foundation-stones of a new Wesleyan mission hall were laid at Derby on Saturday last.

DEAN FARRAR on Saturday inaugurated the handsome pulpit erected in the nave of Canterbury Cathedral in memory of the late Dean Payne Smith.

It is intended to erect a new church (in the place of the present structure in Denmark Road) for the use of the Welsh members of the Church of England in Manchester, if possible during the present year.

THE new marine biological station at Millport was formally opened on May 15. The building, which has already been described, is situated at Keppel Pier, and has been erected and equipped at a cost of about 1,500*l*.

THE Northern Lighthouse Commissioners' steamer *Pharos* sailed from Granton on Saturday last with several of the Commissioners on board, for the purpose of selecting and deciding upon a suitable site for the erection of a lighthouse on the Berwickshire coast.

157 STRAND, W.C. (Four Doors from Somerset House), LONDON.

Vol. LVI. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered, Price 12s. 6d. Office—175 Strand, London, W.C.

WHILE some workmen were excavating sand and gravel at Belfield, Musselburgh, they came across a stone cist in which were found a well-preserved human skeleton and an urn, which were acquired for the Edinburgh University Anatomical Museum by Mr. Simpson, who states that they date back to the Bronze Age.

A MOVEMENT for the restoration of the Twickenham old parish church tower, all that remains of the original building erected, it is supposed, under the superintendence of William of Wykeham, about the middle of the fourteenth century, has been set on foot in celebration of the Queen's reign.

THE foundation-stone of the nave of St. Luke's Church, Deeplish, Rochdale, was on Saturday last laid by Bishop Cramer-Roberts. The eastern portion of the church was erected some ten years ago, when a portion was erected to serve until the state of the funds would allow the building to be completed in suitable style.

It is understood that the return of works executed by the County Council Works Department and completed during the six months between September 30, 1896, and March 31 last will disclose further large and serious losses. The total estimated value of the works is about 75,000*l.*, and it is believed that this estimate has been exceeded by nearly 19,000*l.*

A MONUMENT to Maria Theresa at Pressburg was unveiled on the 16th inst. by the Emperor Francis Joseph, as King of Hungary. The King, who was accompanied by all the arch-dukes and archduchesses at present in Vienna, subsequently attended the dedication of the newly restored Franciscan church on the Hauptplatz, which dates from A.D. 1290.

A FIRE broke out in the east building of the General Post Office, St. Martin's-le-Grand, on the 14th inst., the result of a lighted match thrown into the area by a passer-by. A quantity of waste paper and other rubbish was set alight, but the firemen being soon in attendance, the outbreak was extinguished before much damage was done.

THE completion of the St. Andrew's Fish Dock extension was celebrated on Saturday at Hull by a dinner to the employes of Mr. A. Kellett, the contractor. Twelve months since an accident to the gates occurred, and had it not been for this unfortunate mishap the work would have been completed some ten months ago. Altogether about two and a half years have elapsed since the work was commenced, and much-needed facilities to the fish trade of the port will now be afforded.

THE six months' notice given by the operative stonemasons in Colne for an advance of from 8*d.* to 9*d.* per hour, and the furnishing of a code of working rules as at Nelson, expired on the 14th inst. The masters have expressed their determination, on account of the bad trade, not to concede the advance. The men are almost all members of their trades union. The dispute will affect about 300 men.

THE Sanitary Inspectors' Association of Scotland having been invited to hold their next annual conference in Aberdeen, the Town Council have resolved to give the use of the Town Hall for the meetings, which will commence on June 17 and extend over two days. It was also remitted to the public health committee to make arrangements for the meetings and the entertainment of the delegates.

THE extensive premises of Messrs. Siemens Bros. & Co., Limited, telegraph and electrical engineers, New Charlton, were the scene of an outbreak of fire between four and five o'clock on Tuesday morning, the 18th inst. The fire originated from an unknown cause in a pile of timber in the yard, which, when first discovered, was blazing furiously. Fortunately a hydrant was fixed in the immediate vicinity of the fire, and was promptly brought into use by some of the workmen employed by the firm, and in the space of half an hour the outbreak was extinguished.

THE engineering experts engaged by the Tyne Commissioners to report on the huge breach in the great north pier at the mouth of the Tyne, caused by the severe gales of last winter, have reported that it will be necessary to take down and reconstruct the whole of the pier from the damaged portion to the seaward end, a distance of 750 feet, at an estimated cost of 300,000*l.* The pier itself is 3,000 feet in length, and has been forty years in constructing, being only completed last year.

THE roof of a block of four houses in Victoria Avenue, Lichfield Road, Aston, suddenly collapsed on the 17th inst., occasioning great consternation to the occupiers, but fortunately doing no harm to anyone. The immediate cause of the accident appears to have been the slipping forward of the front wall-plate, which does not appear to have been properly "tied." The misplacement not only resulted in the collapse of the roof, bringing it flat down on to the four walls, but forced over the cornice, the bricks of which fell with a crash along the front of the houses. Happily no one was near at the time. The interiors of the houses sustained but little damage.

Price List and Terms on Application.

THE NEW INCANDESCENT (Sunlight Patent) GAS LIGHTING COMPANY, LIMITED,  
33 & 34 SHOE LANE, LONDON, E.C.

THE memorial-stone of the new infirmary being erected in Paisley was formally laid on Saturday, May 15. The building, which we have already described, is being erected in Barbour Park (lately known as Egypt Park), Calside, from plans prepared by Mr. T. Graham Abercrombie, Paisley. It consists generally of two storeys and attics, with the front portions of the wings, and also the central block, slightly jutting out from the main building. The number of beds provided will be between 140 and 150, and there are different departments for children, and for men and women. All the general arrangements, such as heating, ventilating and lighting, and arrangements in wards have been carried out on the most approved systems, every detail having been carefully studied and attended to, so as to have the building complete in every respect as a first-class hospital. The cost, it is understood, will be 72,000*l*.

OWING to the death of Mr. Charles Hall, the managing partner of the Rugby Portland Cement Company, the position of works manager became vacant, and the directors of the company unanimously selected Mr. Isaac Brooks for the post. Mr. Brooks had been actively engaged assisting Mr. Hall for upwards of twenty-five years, and the unqualified success of the firm is in no small measure due to his energy and enterprise. Recognising that, the authorities, without hesitation, offered him the managership, and he has the best wishes of a very large circle of friends for his continued success and prosperity.

THE Western Baths, Cranworth Street, Hillhead, Glasgow, which have been closed for upwards of three months, have again been opened. The interval has been occupied in decorating and generally renovating the interior. No structural alterations have been made, but the decoration has been entirely altered. The prevailing tones are sage green and cream colour. The entrance-hall is now lighted by a polished brass electrolier and graceful branches on the walls. In the great bath-room the dressing-boxes, the entrances to which form an arcade at each end of the pond, have been reconstructed. The most important change which has been made, however, is in the Turkish cooling-room, the walls of which have been entirely covered with white enamelled tiles, the upper portion of the apartment being finished with a floriated cornice in coloured enamel. The reading-room is specially effective. The walls are covered with figured green hangings for rather more than half their height, and above them there is a deep frieze with a conventional flower design indicated in light sepia colour.

The coved cornice is gilded in dull gold, and the floor is covered with sage green carpet with lighter coloured border specially woven to match the wall-hangings.

### BUILDING AND BUILDERS.

THE plans for the erection of the proposed Empire Palace Theatre, two arcades and a number of shops upon a site on the east side of Briggate have now practically received the approval of the Leeds building clauses committee.

THE foundation-stone of the new Congregational church at Crosby will be laid to-morrow afternoon, the 22nd instant.

PLANS of the new church of St. Martin, Roath, the proposed memorial to Bishop Smythies, have been prepared. The building will accommodate 1,000 and the estimated cost is within 10,000*l*.

THE memorial-stones of a new church were laid on the 15th inst. at Park Hills, Bury, in connection with the United Methodist New Church. The building is to cost about 2,500*l*., towards which 1,600*l*. has been already raised. Mrs. Hall, mother of the ex-mayor, laid the principal stone. The building has been designed by Mr. J. D. Mould, of Manchester. It is to be modern Gothic in style, and will seat 470 persons. A school-chapel was erected about fourteen years ago, which is to be used as a school only in future.

ON Saturday afternoon the foundation-stone of Weston Jubilee church, near Runcorn, was laid by the Dean of Chester (Rev. J. L. Darby). According to the plan, the church will consist of nave, chancel, with tower and spire at the west end. Owing to the fall of the ground, the vestries are placed under the chancel. The style is Early Gothic in design, the walls furnished, interior and exterior, with Runcorn red sandstone, being chiselled and more finely finished. The accommodation provides for 350, and the cost will be about 3,000*l*.

### PLASTERERS' STRIKE, LIVERPOOL.

THE plasterers in Liverpool gave six months' notice, expiring on May 1 last, to the employers for an advance of  $\frac{1}{2}$ *d*. per hour, from 9*d*. to 9 $\frac{1}{2}$ *d*., and a new code of working rules, chief amongst which were clauses limiting the number of apprentices, no person other than a plasterer to be allowed to do plasterer's

work (which the operatives contend includes cement flooring, floating for tiles and wood blocks). Several meetings have been held between the masters and men, and as a result thereof the employers made an offer to the operatives for an advance in wages to 9½d. per hour, the present code of rules as worked to by the other trades being offered with an undertaking that only plasterers be employed by master plasterers to do plasterer's work, concrete and cement flooring, floating for tiles and wood blocks to be considered the work of specialists, and that all apprentices be bound. This was refused, and the men to the number of about 150 ceased work on May 1. A further offer by the masters to submit the whole matter to arbitration was also declined.

### JUBILEE STANDS.

ST. PAUL'S at the present moment, says the *Daily Telegraph*, is the busiest scene in London. Perhaps the usual quietness and solemnity of the place—a quarter of the metropolis given over to the cooings of pigeons, too fat and certainly too lazy to fly away from the passer-by—and the silent reverential manners of the pilgrims to this shrine have something to do, by force of contrast, with the impression of activity that one gets from a visit to St. Paul's just now. There is nothing but jubilee in the air of the neighbourhood. The workmen tearing down Messrs. James Spence & Co.'s premises are taking night and day turns. Opposite, at the big Pawson & Leaf building, all the windows, except those on the ground-floor, are being taken out, and preparations are rapidly going forward to receive a crowd estimated at 2,000 persons. St. Paul's itself resembles a beleaguered fortress, around which the enemy has pressed his earthworks and mines right up to the last moat, so that the garrison must starve, surrender or make a desperate sortie. The scaffolding high up on the front of the cathedral is not in the way of Jubilee preparation—many doubtless wish it was—but on the south side and the eastern end, where the parade will sweep round into Cheapside after the ceremonies, there is a regular series of barrack-like, woodwork fortifications. The City Corporation platform, on the east end of St. Paul's southern face, will seat, it is calculated, 2,600 of the officials and their families. West of the central porch, on the south side, there will be places for at least 4,000 more, and another 1,000 to 1,500 City authorities and their friends will be able to watch the brilliant procession as it turns into Cheapside, from the stockade-like structure at

the north-east corner of St. Paul's Churchyard. These people, however, will miss what is taking place almost within hearing of them on the other side of the church.

The big pavilion erected on the site of Messrs. James Spence & Co.'s building is rapidly taking shape. It will have four storeys or tiers, and each tier will have twelve rows of seats, with places on every one for from forty to fifty people. The work in this instance is being done with special speed, the builder being under contract to complete his task before June 17, in order that the work of decoration may be commenced.

Messrs. Pawson & Leaf's premises have only just been leased by a syndicate of well-known public men, and rows of places are being built in all the floors, 193 windows being taken out temporarily. The six-storey edifice, which is fireproof, bears directly on the steps by which Her Majesty's carriage will be drawn up, facing the south, and is furnished with lifts. It has the further advantage of an entrance on Godliman Street, so that spectators may come in by the rear at their own convenience from Victoria Street. The alterations are being so arranged that there will be several private rooms from which all that goes on may be seen. The refreshments will be served by the Imperial Institute staff and chef. Although the City Fathers and their friends on the south of St. Paul's will not be able to see the cortège at rest, their view of the starting of the parade immediately after and its slow winding into Cheapside will be almost enough to make up for the deprivation. Only about 10,000 people altogether will witness the solemnities at St. Paul's.

Following the route of the procession, after leaving St. Paul's, but little further preparations for witnessing it can be found until the Borough is passed. Cheapside does not lend itself to more than tasty decorations and watching the spectacle from the windows. The prospects of a stand at the church as the carriages enter King William Street are dubious. This place of worship, it will be remembered, has just passed into the hands of the railway company, who want its site for a station. Preparations are scarcely active yet on this side of London Bridge.

St. George's Circus will be a great point for massed spectators. A fine platform is going up at the School for the Indigent Blind. Facilities for between 1,500 and 1,700 onlookers will be provided, extending along the front and the Lambeth Road side of this building, an excellent sight of the parade being afforded. Tickets are being snapped up at from one to five guineas each, the proceeds being devoted

## SIR WILLIAM BURNETT & CO.'S

Timber Preserving Solution, &c.  
THE HYDRARGYRUM CUM ZINCO PROCESS  
(CHURTON'S PATENT, 1895).

For over fifty years the firm of SIR WILLIAM BURNETT & CO. have been preparing a solution for the preservation of Timber, Felt, Canvas, Hose, Sacks, &c., from dry or wet rot, the attacks of insects, vermin (rats, &c.). Particulars and prices, with testimonials of the Sole London Agents:—

WILSON &amp; CO., 11 PHILPOT LANE, LONDON, E.C.

to a deserving charity, as the chaplain and secretary, the Rev. St. Clare Hill, insisted on going into the speculation himself, in order to raise every possible penny, rather than to let the premises for a lump sum. The Royal Eye Hospital, almost exactly opposite the School for the Indigent Blind, will not order anything too large to interfere with the fine view from its large windows. It is calculated that, with the roof, 500 holiday-makers will see the parade from the Royal Eye Hospital. A little further along Westminster Bridge Road are the Yorkshire Schools. This location has been sold for 700%, the money to be used for educating Yorkshiremen's children; but it is noteworthy that there are 602 seats, and that, allowing for the cost of erecting seats, 500% appears to be lost. The site at the Roman Catholic Club, near by, has also been sold to speculators for a good figure; the sum will go to support the members' interests.

At St. Thomas's, almost opposite the Southwark Cathedral, where preparations are also going forward rapidly, accommodations estimated to seat 800 people are being erected. The work on the staging at Christ's Church, at the corner of Kennington Road, giving on the procession as it turns up to Westminster Bridge, was begun yesterday. The church people are letting their own stalls, and expect to reap a nice sum with which to do good. No. 232 Westminster Bridge Road is being pulled down, and a neat box erected which will probably hold about 500 people. The work in front of and at the corner of St. Thomas's Hospital is progressing steadily. The 1,300 seats provided here were nearly all taken by the governors of the institution. There will be eleven tiers of spectators in front of St. Thomas's and eight rows at the Lambeth Palace Road corner, with a refreshment tent upstairs. The cards are already being sent out.

The Office of Works is doing so well for the members of Parliament and their friends that the efforts promise to take in every man who ever represented a constituency. There is a huge network of timbers in front of St. Stephen's, just above the clock tower, and another below it, even larger, to say nothing of a commodious pavilion in Parliament Square. All are particularly substantial-looking. Some arrangements are being made at St. Stephen's Club, at the corner of the Thames Embankment, probably only for members. The Whitehall Club, in Parliament Street, is getting up a strong outside balcony capable of seating between 300 and 400 people.

Opposite the Home Office a well-planned structure, capable of seating 1,000 persons, is going up. The carpenters are also

at work in front of Montagu House. A private party of 300 people are here to be the guests of their Graces of Buccleuch. Next to the Commissioner of Charities another good-sized stand is building, and seats are being placed over the Scottish Office opposite. The most important of the Whitehall platforms is the one at the corner of Horse Guards Avenue. This structure has room for 5,000 chairs, which are selling fast, at from four to twenty guineas each. There will be four sloping tiers on each floor, including the roof, the ground level being let in stalls.

At the south side of Constitution Hill will be one long grand stand from which to view the parade. The tiers of seats are already almost fit to receive the boards on the Buckingham Palace end, and the line will extend right up to the arch at Hyde Park Corner. It is estimated that there will be places for close on 15,000 people. Balconies and stagings will be erected at St. George's Hospital, the work being already begun. There are no indications as yet of any arrangements for seeing the parade, as it passes along Piccadilly, being made in the park on one side. In front of the National Gallery, and over a portion of Trafalgar Square, the arrangements are fast approaching completion. At St. Martin's Church the preparations will soon conceal the lower side and almost the front of the building. This pavilion extends all the way down Duncannon Street, and up at the back of the houses on the Adelaide Street side. Advantage is taken of the fact that the Royal cortège will come straight down Duncannon Street to erect a large platform in the cab yard at the Charing Cross station. The two churches in the Strand will reap a benefit from their fortunate position, both putting up substantial and comfortable accommodation for visitors. The building at the corner of Norfolk Street also offers a prospect of a good view of the Queen as Her Majesty goes by, and the lower floor is being turned into a grand stand. A like structure is also being erected at the Law Courts.

### THE NORTH SHORE SCHEME, BLACKPOOL.

A CORRESPONDENT of the *Leeds Mercury* writes:—No more enterprising community than that of Blackpool is to be found within these sea-girt isles. The progress which it has made, and is still making, is simply amazing. The success has been well earned. Dependent for their prosperity upon the visitors who come to the town each season, the inhabitants have spared no pains in their efforts to make the place attractive. Improve-

ments have followed one another in rapid succession. The ratepayers have never grudged the money spent in this wise. They have the good sense to realise that though the amounts disbursed are large, the investments will bring in an adequate return. As a matter of fact, the inhabitants have not much cause for complaint on the score of rates, their liabilities being within five shillings in the pound. An exception must be made of those who occupy property "on the front," for they have the privilege of paying a special parade rate—but they get a very fair *quid pro quo*. Is this parade rate peculiar to Blackpool? It seems a distinctly just and reasonable imposition, because at all seaside resorts the houses from which a sea view is obtainable naturally do the biggest business. The improvement of the parade enhances the value of the property abutting on it, and at Blackpool the occupiers of the property have to pay for the betterment. Of course, every care is exercised by the authorities to insure the whole of the proceeds of the parade rate being devoted to the purpose for which it is levied.

At the present moment the Corporation have on hand what is known as the North Shore Scheme. This is a gigantic undertaking, and will entail an expenditure of 90,000*l*. It comprises the construction of a sea-wall three-quarters of a mile in length. The north end of the wall is close to the Gynn estate. The work is not being carried out a minute too soon. All the world has heard of the fury of the Blackpool tides. These form very fine spectacles when viewed at a respectable distance, but they are uncommonly destructive. The cliff at this particular point was being rapidly washed away, and some fine new houses built near the front were more than once in serious danger. That danger happily exists no longer. The contractor, Mr. R. Finnegan, of Northampton, made a start with the North Shore scheme in November 1895, and the bulk of the heavy work is now completed. There is still, however, much to be done, and another twelve months will elapse before the undertaking receives its finishing touches. The operations have at times been carried on under great difficulties. Two or three terrific storms have wrought an immense amount of damage. Mr. Finnegan tells some stories about the power of the waves which seem well-nigh incredible. Huge blocks of concrete and granite, which no three men could lift, have been hurled great distances by the angry tides. Despite these tempests, however, steady progress has been made. The work is of a most substantial character. Mr. J. Wolstenholme, C.E., the borough surveyor, is responsible for the plans, and he has taken every

possible precaution to prevent the happening of anything untoward. The wall is built of concrete, is faced with concrete blocks, and is 7 feet 6 inches thick. It assumes a gracefully curved form, so as to lessen, as far as possible, the force of the waves. In front of the wall there is what is known as a "sea defence." This is a slope running down into the solid clay, formed of granite hulkings stones laid in concrete. Some people may be interested in knowing that the granite has come from Shap in Westmoreland, from Threlkeld in Cumberland, from Penmaenmawr in North Wales, and from Cornwall—14,000 tons of it altogether. Immediately behind the sea-wall there will be a concreted promenade 5 yards wide, which is certain to prove a very popular place of resort. There is to be a seat running the whole length. From this promenade an embankment will spring, forming a slope which is to be covered with rustic work and grass. At the top there will be another promenade 50 feet wide, and made of asphalt. Beyond this, again, is another slope, which is to be laid out with flower-beds, grass plots and walks. Then comes the Queen's Drive, which is to be greatly improved. On the westerly side of it there will, for example, be a footpath 4 yards in width. This, roughly, is a description of the North Shore scheme.

### COUNTY COUNCIL CONTRACTING.

A RETURN has been prepared by the works committee of the London County Council showing the cost of works completed and certified between March 31 and September 30, 1896. The return of estimated works so completed shows that some very large and serious losses have been made. It relates to fifteen works, in only six of which has the actual cost been below the final estimate, the aggregate saving amounting to 734*l*. On the remaining nine works there has been a total loss of 8,260*l*. The most serious loss shown is that upon the execution of some temporary buildings at Colney Hatch Asylum, where the actual cost of the work has exceeded the final estimate by 3,827*l*. The original estimate for the work as passed by the Council was 17,500*l*, the final estimate, which included certain additions, 19,114*l*, and the actual cost 22,942*l*. Originally the asylums committee advertised in the usual way for tenders for this work, but only one tender was received, amounting to 18,812*l*, which was considerably in excess of the resident engineer's estimate. The works committee were then approached, and offered to do the work for 17,500*l*. On

14 VICTORIA STREET LONDON; AND BLACKFRIARS BRIDGE, MANCHESTER.

completion of the job the works committee sent in a claim to the asylums committee for 2,920*l.* for extras, out of which the engineer of the asylum reported that he could only allow the sum of 310*l.* Arbitration was suggested, but ultimately, if the Council consents, the asylums committee, in addition to the 310*l.*, are willing to pay one-half of the balance for extras claimed. Mr. Adams, the manager of the Works Department, in his report upon the reasons for the large deficiency on this work, states that it was taken at too low a price, owing to successive reductions made by the late manager in his original estimate in order to bring his total down to the same amount as that presented by the resident engineer. The work, he says, was started hurriedly, no proper drawings had been supplied at the time of preparing the estimate, more materials were supplied than necessary and had to be returned, and owing to anxiety to meet the wishes of the asylums committee and to hand over the building as completed, block by block, more men were engaged on the work than could profitably be employed, having regard to cost of work only. The finance committee, reporting upon the application of the works committee for an excess vote of 3,827*l.* and of the asylums committee for an excess vote of 1,304*l.* for this work, state that it appears that no proper estimate was prepared or taken out. They call special attention to this point because the Council's control over expenditure largely rests upon estimates, and it is therefore important that all estimates should be carefully framed.

Another large loss is shown on the Shelton Street dwellings, where the deficiency amounts to 2,607*l.*, the final estimate for the work being 14,416*l.*, and the actual cost 17,028*l.* Commenting upon this loss the manager of the department states that there were considerable delays after the work was started in carrying it out for which the department was not responsible, and these delays enhanced its cost. The blocks of buildings were in very confined areas and separated from one another by intervening streets and houses, causing great inconvenience and increasing the cost for superintendence, lighting and watching. The works committee point out that the original estimate for the work was made in 1894 and a rise in value both of labour and materials took place in the course of the following year. The strike in the building trade, which was impending during the execution of the work, actually occurred before it was finished. In the opinion of Mr. Rowland Plumbe, one of the architectural officers of the Council, the loss on the work from delays, difficult conditions and the state

of the labour market was greater than a skilful contractor would have allowed himself to suffer, though a contractor of ordinary calibre would very likely have done as badly as the Council. The lesson, the committee think, to be learned from the job is one of caution in undertaking works which are not of a straightforward character. With reference to the excess vote of 2,607*l.* asked for in respect to these buildings, the finance committee state that they have already pointed out the exceptional inconvenience attending any excess of cost over estimate in respect of artisans' dwellings erected by the Council, because they are only agreed to by the Council upon carefully-prepared estimates with calculations to show the effect upon the county rate. The excess of cost of 2,607*l.* in the present case meant an addition of 103*l.* to the annual charge for interest on the sinking fund for capital outlay, which, unless it could be met by increased rents or savings in maintenance and management, would constitute an annual charge on the county rate throughout the loan period of upwards of 50 years.

The other losses shown in the return relate to the following works:—Crossness outfall gridiron, where the excess over estimate amounted to 1,078*l.* on work estimated to cost 3,219*l.*; Barking outfall, alterations to pier, excess, 206*l.*; Victoria Embankment storeyard wall, 98*l.*; Sandys Row improvement, 345*l.*; Battersea river-station causeway, 88*l.* There are also two other minor losses. The aggregate of the fifteen works reported upon shows—final estimate 52,133*l.*, actual cost 59,690*l.* This is an increase of 20 per cent. on the original estimates.

A summary of estimated works completed and reported to the Council since the commencement of operations by the works committee in March 1893 shows that the final estimates have amounted to 435,672*l.* and the actual cost to 437,334*l.*

The accounts for jobbing works executed during the half-year show that a considerable saving over schedule prices has been effected. The value at schedule prices of the work executed was 9,989*l.* and the actual cost 8,981*l.*, or a saving of over 1,000*l.* The largest savings are shown on work done for the main drainage, bridges and housing of the working classes committees.

In view of the facts disclosed in this report, Lord Onslow has given notice that when the report of the special committee on the Works Department comes up for consideration he will move as an amendment to the recommendations:—"That the Council, being satisfied from the evidence submitted and the further report of the works committee that work executed for it by the Works Department is not superior in quality to

that executed by contractors, and that considerable loss has been sustained in consequence of the operations of the Works Department, resolves that no further work be entrusted to that department, and that it be referred to the general purposes committee to consider and report as to the arrangements necessary for the due completion of the works in hand and for dealing with the central works in Belvedere Road."

### COMPENSATION CASE.

THE case of Reid v. Wallasey Urban District Council was heard at the Liverpool Law Association rooms. Mr. George Bradbury, F.R.I.B.A., president of the Liverpool Architectural Society, sat as umpire. Mr. Joseph Henry McGovern, F.L.A.S., Liverpool, was arbitrator for the claimant, Mr. Hugh Reid; and Mr. Henry Hartley, F.R.I.B.A., Liverpool, was arbitrator for the Council. Mr. Tobin, barrister, instructed by Messrs. Simpson, North & Co., represented Mr. Reid. Mr. Wm. Danger, law clerk, appeared for the promoters. The claim was made under Sec. 308, Public Health Act, 1875, and was in respect of damage done to the claimant's crops on the Model Farm, Mill Lane, Liscard, and for prospective damage which might arise owing to the easement which the construction of a sewer running through the farm would give. It appears that a 12-inch sewer had been laid by the local authority some sixteen to eighteen years ago with two lampholes, and now a 21-inch sewer with nine ventilating manholes had been substituted. The Council did not proceed under Sec. 18 of the Act which provides for a reconstruction, but did so under Sec. 16 which deals with new sewers. No evidence was tendered by the Council as to having purchased an easement from the owners of the fee-simple, or that compensation had been given to the previous tenant. Mr. Reid had a two years certain tenancy. The claimant was examined at length regarding the agricultural portion of his claim, which amounted to 21*l.* 9*s.* 4*d.* for present damage, in addition to which Mr. Thos. Cook, F.R.I.B.A., J.P., Liverpool, valued the future damage at 8*l.* 4*s.* 11*d.*, including some other items, viz. interference with the level of the ditch and subdrainage, in all 29*l.* 6*s.* 8*d.* Mr. Stretch, farmer and auctioneer, Aughton, Ormskirk, Mr. J. Wright, farmer, Walton, and Mr. Rainford, farmer, Altcar, corroborated the agricultural part of the claim. Mr. Danger, on behalf of the Council, said he had never heard of any sum being awarded

to a yearly tenant in respect of prospective damage; if Mr. Reid was injured in the future in any way he could make another claim. The Council had offered the claimant 50*l.*, which he thought was ample. He called Mr. T. T. Wainwright, F.S.I., Liverpool, who valued the damage at 46*l.* 9*s.* 11*d.*; Mr. J. Yeowart, farmer, Cheshire, thought 31*l.* 7*s.* 6*d.* sufficient; and Mr. Lamb, farmer, Cheshire, assessed the injury at 30*l.* Several of the Council's officials gave evidence as to the former levels of the ditch, construction of the sewer and position of the manholes, one of which interfered with the watercourse in the ditch. Mr. Tobin contended that both present and prospective damage had now to be assessed, as his client could not come before them again to make another claim. The easement would carry with it the substitution and repair of pipes and a right of way along the line of sewer and other privileges, and cited the case of Codack v. Somerville. Mr. Danger said if a sum for prospective damage was included in the award he would ask that it be mentioned separately, as in such an event he intended to state a case. The umpire and arbitrators visited the *locus in quo*. The umpire has since awarded the claimant the sum of 127*l.* 7*s.* 8*d.* and costs. No sum is included for prospective damage.

### COTTAGE SANITATION.

A MEETING of the Yorkshire Branch of the Sanitary Inspectors' Association was held in the town hall, Dewsbury, on Monday, the 10th inst. The subject discussed was cottage sanitation. Mr. Pridgin Teale, who presided, stated what had been done by the Royal Agricultural Society to have the subject properly dealt with in a pamphlet for public use in country places, and the part he himself, and others interested in sanitary science, had taken in preparing matter for the first and the second edition of that work. He said that one of their suggestions was that in rural places there ought to be committees formed, consisting in each of the squire, the clergyman, the non-conformist ministers and of other persons who took an interest in sanitation, and said a similar idea had been carried out in the formation of parish councils. Incidentally, he asked what was done in Dewsbury in the matter of back-to-back houses. He was told by the Mayor, and also by Alderman Kilburn, that such were prohibited being erected in Dewsbury, the latter, however, explaining how, by the construction of blocks of four cottages, cheap and yet sanitary dwellings could be built.

# CARBOLINEUM AVENARIUS, REGD PATENT WOOD PRESERVATIVE.

CARBOLINEUM AVENARIUS, the well-known Wood Preservative, enters the wood by its own action, and does not require a costly plant and machinery like other wood preservatives.

CARBOLINEUM AVENARIUS entirely prevents dampness in brick and stone walls, also wet and dry rot in timber above or below ground, and is used by all the Railway Companies and by leading Builders, Brewers, Contractors, Estate Agents, Mine Owners, &c. in the United Kingdom.

CARBOLINEUM ONLY TO BE HAD FROM

"CLIMAX" PATENT DIRECT-ACTING VENTILATORS. 150 HOPE STREET, GLASGOW.

The Mayor explained what had been done in Dewsbury to promote the health and well-being of the borough, mentioning especially the efficiency of the refuse destructor and of the sewage disposal works, and the excellence and magnitude of the public baths, which he stated were largely used, not only by people of the town, but those of the villages adjoining; the electric lighting and the waterworks were amongst the best in the country and had cost 334,374*l*.

### TUNNEL BETWEEN SCOTLAND AND IRELAND.

AT the quarterly meeting of the Belfast Chamber of Commerce on the 13th inst., Mr. James McConnell, one of the Belfast Harbour Commissioners, brought forward the subject of the proposed tunnel between Scotland and Ireland. He said:—It is held by the most eminent engineers that the scheme is quite feasible and practicable, and I believe there never was so favourable a time or opportunity as the present for enlisting the active support of the Government of this country. Mr. Arnold Forster, M.P., brought the matter very forcibly before the House of Commons two months ago, and obtained a promise from Mr. Balfour, the First Lord of the Treasury, that he would consult the President of the Board of Trade. The latter has expressed himself as not indisposed to carry the matter further. At present Mr. Forster is preparing a précis for Mr. Ritchie of the available facts and data connected with the enterprise. It is the duty of this Chamber to strengthen the hands of Mr. Forster, and to assist him to the utmost by bringing all the pressure possible on the Government to get them to undertake the trials without further delay. It is now nearly thirty years since Mr. L. L. M'Assey, B.L., C.E., brought before the public a scheme for making a tunnel from Tor Head to the Mull of Cantyre. Since then various schemes have been mooted, but of them all the best and most feasible are those of Messrs. Barton, of Dundalk, and Mr. McCullough, of Belfast. The scheme of Messrs. Barton is to connect Island Magee with Portobello, in Wigtownshire, some 26½ miles, by a tunnel. The greatest depth of water to be passed under would be 504 feet, with a ruling gradient of 1 in 75. The estimated cost of this is eight millions, some say ten millions. Their plan shows a sharp bend to avoid the deep part of the loch near the Scottish coast, but lengthens the tunnel by three miles. The other scheme is that of Mr. F. W. McCullough, C.E., of Belfast, which shows 23½ miles of sea tunnel, and land approaches 3½ miles. This

gives three miles less of sea and three miles less of land approach than Messrs. Barton's, but has a maximum depth of sea bottom of 650 feet, and ruling gradient of 1 in 52. The estimated cost of this is seven millions, some seven or eight millions. Both these schemes provide a double line of railway. We should take the advice so often given by prominent public men, and agitate. There cannot be two opinions as to the immense advantages, commercial and other, that would accrue to these countries, and especially to Ireland, through being united actually and practically by a tunnel, which would bring Belfast within four hours' railway of Glasgow, six and a half hours' of Leeds, and eleven hours' of London. The scheme—like the introduction of the railway system—would result in a vast increase of traffic and intercourse generally, and would by no means injure, but possibly help that by steamer. Belfast would gain largely by having not only English and Scottish buyers and visitors coming in vastly increased numbers. Legions of our American cousins would be induced to come our way, and possibly ere long the west of Ireland ports would be the terminal stations of the traffic between Europe and America. In addition to the improved and advantageous communication which the tunnel would secure between Europe and America, there would be, as has lately been pointed out in an article in the *Contemporary Review*, the benefits of having as an alternative to the existing overland route to India, Australia and the Far East, an equally expeditious route through British territory by this Irish route and British North America. The tunnel might not, commercially speaking, be a paying speculation, but as a scheme of great national importance the Government are well entitled to make this tunnel out of imperial funds, or to guarantee a fair interest on the cost. For, as was pointed out by Mr. McCrory at the Belfast town meeting in 1890, all the cost would be far more than compensated for by the Imperial and commercial advantages which it would bring. It is stated on good authority that the following statement in the *Nineteenth Century* for March is Lord Wolsey's:—"It is of great national importance that we should have the easiest possible means of communication between the two islands, and before we embark on any dangerous scheme for uniting us with France in the hope that increased means of communication between the two nations will reduce all hostility and enmity between them, let us try the experiment with Ireland. Let us try the effect of a tunnel on the Irish question, and see whether such a description of union might not be more successful in binding together the people of

the two countries than was the political Union of 1800." I beg to move:—"That this Chamber believes the time has arrived when the Irish Channel Tunnel question should be vigorously pressed, and as it is of national importance the Chamber considers that the Government should arrange for having borings and soundings made in order to test its practicability, and that we should now appoint a committee which may send a deputation to wait on the President of the Board of Trade and Secretary of the Treasury to urge them to move in the matter at the earliest possible date."

The resolution was agreed to unanimously.

### PLUMBERS' REGISTRATION BILL.

THE Standing Committee on Trade have finally considered the Plumbers' Registration Bill.

On clause 11, which deals with the removal of names from the register for misconduct and the restoration thereof, incorporating for that purpose three sections of the Dentists' Act, Mr. Tomlinson, Mr. Samuel and Mr. Whittaker protested against this legislation by reference, Mr. Whittaker stating that it was ludicrous to expect a country plumber to master, not only this Bill, but an Act dealing with dentists. It was suggested that the sections referred to be incorporated in a schedule, but Mr. T. W. Russell said it was most unusual to do this, and he must decline to do it.

An amendment was made in this clause, on the motion of Mr. Ascroft, which enabled the Local Government Board to make orders as to their own costs, and as to the costs of successful party in any appeal to the Board against the removal of a name from the register. The clause as amended was then agreed to.

A discussion took place on clause 12 as to the qualification of persons who should be entitled without examination to be registered, and ultimately the committee agreed to the following definition:—"All persons who have been engaged wholly or partially in business as plumbers, or employers of plumbers in connection with the businesses of builders, ironmongers, sanitary engineers or other occupation of the like nature prior to March 1, 1892, who shall be entitled to be registered without examination under rules to be framed by the General Council, provided that no firm shall be entitled to be registered under this Act." The clause as amended was agreed to.

In the definition clause the following definitions were inserted:—"Master plumbers" means those employers of plumbers who have *bona fide* practised at the craft, or who have been registered by the Company prior to the passing of the Act; "operative plumbers" means those who have *bona fide* practised at the craft, or are practising, or who have been registered by the Company prior to the passing of this Act.

On the motion of Mr. T. W. Russell, the committee inserted a code of rules dealing with the election of members of the General Council.

The schedules having been dealt with, the Bill as amended was ordered to be reported to the House.

### SCIENCE AND ART GRANTS.

THE report of the committee appointed by the Duke of Devonshire, President of the Council, to inquire into the distribution of Science and Art grants, has been issued, together with a revised edition of the Science and Art Directory embodying the recommendations of the committee, as a Blue-book. The committee consisted of Sir J. Gorst, M.P. (chairman), Lord Balfour, Mrs. Sidgwick, Major-General Sir J. Donnelly, Sir H. Roscoe, Mr. G. L. Ryder, C.B., Professor Jebb, M.P., Mr. W. Armstrong and Captain W. de W. Abney, C.B. (who acted as secretary); and the order of reference includes sub-head D. of the Science and Art Vote and that part of the sub-head G. of the same vote which dealt with the payment for drawing and manual instruction in elementary schools. The combined grants referred to the committee now exceed 500,000/., and are increasing. The committee have had before them the report of the Secondary Education Commission and the evidence taken; also statements and suggestions from various educational bodies; and as a result of their investigation and deliberations they have revised the regulations in the directory which govern the grants made by the Science and Art Department.

The most important changes recommended may be given. Under the head of the "Management of Schools and Classes" the committee have inserted in the directory the following clause, which is founded upon a recommendation of the Royal Commission:—"In counties and county boroughs in England possessing an organisation for the promotion of secondary education, the authority so constituted may notify its willingness to be responsible for the science and art instruction within its area. In such case while the rights of the managers of

# W. DUFFY'S PATENT IMMOVABLE ACME WOOD BLOCK FLOORING.

THE PERFECT FLOORING FOR ALL PURPOSES.

Seven Gold Medals, four Silver, two Bronze Medals, and Certificate of Sanitary Institute of Great Britain.

THE ACME WOOD FLOORING COMPANY, Ltd.,

Chief Office and Works:—GAINSBOROUGH ROAD, VICTORIA PARK, LONDON, N.E.

ARCHITECTURE, FURNISHING, DECORATION, FINE ARTS.

E. LYON-CLAESEN, Publisher, 8 Rue Berckmans, Brussels.

The house makes a specialty of publishing artistic editions of all kinds—*éditions de luxe*—and can supply all the works treating the subjects of Architecture, the Industrial and Decorative Arts, Furniture, Painting, Sculpture, the Fine Arts, &c.

TOURS ET TOURELLES HISTORIQUES DE LA BELGIQUE, or THE HISTORIC TOWERS AND TURRETS OF BELGIUM. From the water-colours of JEAN BAES. Among the architectural publications on the ancient edifices of Belgium, scarcely any can be found which give a reproduction of the admirable towers and charming turrets, so justly considered of the greatest interest. This work consists of 50 coloured folio plates, difficult to distinguish from the originals, mounted on handsome cardboard and contained in a rich portfolio. Price £4.

TRAVAUX D'ARCHITECTURE EXECUTÉS EN BELGIQUE, or ARCHITECTURAL WORKS EXECUTED IN BELGIUM, by HENRY BEYAERT, Architect. This work contains the most interesting productions of Henry Beyaert, and presents, with fullest details, his principal edifices. It is the reproduction of his own designs arranged by himself. Each construction is explained by plans, details, elevations, sections, &c., drawn to scale. The work will be published in twenty to twenty-five parts, consisting of ten folio plates each, appearing quarterly. Thirteen parts are already out. Subscriptions are received for the entire work only. Price per part, 12s.

### L'EMULATION.

A MONTHLY JOURNAL. ORGAN OF THE "SOCIÉTÉ CENTRALE D'ARCHITECTURE" OF BELGIUM.

The latest volume of the New Series is in preparation, and will form a valuable addition to the Collection. Each number consists of four or five folio plates, eight pages of text, and a supplement of twelve pages. It produces in chromolithography, heliogravure, phototype, etching, &c., prominent examples of ancient and current architecture, and the text is devoted to this profession. The Supplement contains articles pertinent to architecture, and advertisements. Subscriptions date from January 1. Price per year, £1 8s. The whole year, when complete, in portfolio, £1 12s.

E. LYON-CLAESEN, ART PUBLISHER, BRUSSELS (BELGIUM).

existing schools and classes will be preserved, no managers of a new school or class will, except under special circumstances, be recognised unless they are responsible to such authority. In Wales the intermediate education authority is for this purpose regarded as the authority for the promotion of secondary education." This recognition of local authorities as those who should be responsible for secondary education will, in the opinion of the committee, simplify the work of central administration, secure greater efficiency in the schools, and be a protection against their undue competition and multiplication. As to "Literary Instruction" the Royal Commission, in dealing with the grants made by the Science and Art Department, stated that in order to meet the new conditions the Department needed to be more liberal in its recognition of literary subjects and to feel that they were essential to education and not alien to science. The committee have inclined to this view and in order to give a stimulus to students in evening science and art classes in England to improve their general education and to encourage the study of languages and literary and economic subjects they recommend that where any *bona-fide* student of these classes desires such instruction a grant should, under somewhat stringent conditions, be made on his behalf to classes held by University extension authorities. This, it is thought, will meet the objection that the science and art grants tend to encourage a one-sided education, while it is improbable that it will ever absorb more than an infinitesimal portion of the grants.

Hitherto it has been laid down that no payments can be made on account of students whose means do not come within certain categories. Such restrictions, the committee state, have been abolished in the case of elementary education as inflicting an undesirable stigma upon those whose education is assisted by the State, and they recommend the abolition of all restrictions of this kind, but to prevent abuse they have added a regulation that schools in receipt of payments must be "approved by the Department as suitable in character and financial position to receive aid from public funds." With the same object it is proposed to abolish the restrictions placed on persons eligible to hold certain scholarships and exhibitions, but a provision has been added that "the Department may refuse to fill them with persons whose circumstances do not appear to warrant such aid." With reference to drawing and manual instruction in elementary schools the committee recommend that the administration of the grant should be transferred in England and Wales and in Scotland to the English and Scotch Education Departments respectively. This is based on the grounds

that all the instruction in an elementary school should be under the same administration and inspection, and that in England and Wales drawing is a compulsory class subject.

All the members of the committee sign the report, Mr. G. L. Ryder (of the Treasury) adding the reservation that he was obliged to withhold his assent from that part relating to literary instruction as being apparently outside the terms of the order of reference.

### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

### APPLICATIONS FOR PATENTS.

10929. Philip Louis Renouf, for "Improvements in and connected with the building of tubular frames."

10942. James Joseph Dixon, for "Window-locking attachment."

10953. Francis Johnson, for "Improvements in machinery for pressing bricks and other blocks."

10984. Percy Hubbard, for "An improved catch or fastening for doors, flaps, shutters and the like."

10991. Arthur Wakefield, for "Improvements in and relating to the joining of stoneware and other like pipes."

10993. Elemér Muranyi, for "Improvements in hinges for doors, windows and the like."

11011. Odelia Hitchen, for "Improvements in window-washers."

11050. James Miller Robb, for "Improvements in door-handles."

11069. Thomas Watson, for "Improvements in roofs or coverings for brick kilns."

11093. William David, for "Improvements in sash-fasteners."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

# THE NEW EXPANDED METAL

**Mesher from 1/8th in. to 6 in. wide. Strands from 24 B.W.G. to 3/8th in. thickness of steel.**

**FOR BUILDING CONSTRUCTION**, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

**FOR SOLID PLASTER PARTITIONS**, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

**FOR FIREPROOF LATHING**, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

**FOR CONCRETE FLOORS WITH EXPANDED METAL**.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

**FOR EXTERIOR WALLS OF BUILDINGS**.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

**FOR FENCING, TREE GUARDS, WINDOW GUARDS**, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

**OTHER USES FOR EXPANDED METAL**.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

**BRASS, ALUMINIUM**, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

**CATALOGUES AND PRICE LISTS** can be obtained on application. Also copy of a REPORT by an EMINENT FIRM OF ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

**THE EXPANDED METAL COMPANY, LTD.,**

UNEQUALLED FOR ALL DECORATIVE PURPOSES.

**Aspinall's**

**ENAMEL**

For Inside and Outside Work.

**READY FOR USE.**

This Enamel, which has taken the Highest Award wherever exhibited, imparts a rich glossy appearance to all surfaces to which it is applied, and dries with a hard impervious surface as washable as porcelain. It is admirably adapted for use in Hospitals, Public Institutions, Mansions, Private Houses, &c., where sanitary conditions are of the first importance. One gallon will cover about seventy square yards on a non-porous surface, and is equal to about three gallons of mixed paint.

**ASPINALL'S ENAMEL** can be made to any tint, is absolutely non-poisonous, and is unequalled for *all* decorative purposes.

Builders and Decorators should apply for full particulars of our special "DECORATOR'S" ENAMEL.

**ASPINALL'S ENAMEL. LTD., NEW CROSS, LONDON, S.E.**

## TRADE NOTES.

A REREDOS of Caen stone and alabaster has just been erected in Finstall Church, near Bromsgrove, to the memory of the late Rev. J. H. Bainbrigg. It consists of three arcades with gable tops supported by pillars of green marble; the centre panel has a large figure of Our Saviour as the "Good Shepherd," and the two side ones the Alpha and Omega, with floriated decoration. The work has been successfully carried out by Messrs. Jones & Willis, 79 Edmund Street, Birmingham.

MESSRS. PARKERS', LIMITED, of Conybere Street and Corporation Street, Birmingham, have secured a large contract for furniture for wards and nurses' home for the new General Hospital. Messrs. Parkers' machinery and plant are eminently suited to work of this character, especially as the time allowed for completion of the contract is only six weeks.

MESSRS. HOLLIS BROS. & Co., Leicester and Hull, are well known among architects and contractors between Newcastle and London for their high-class mouldings, and the quality and durability of their wood-block flooring. In the latter branch men of long experience are employed in the work of laying, and great satisfaction has been given in important work. The firm have now commenced on a new mill in Hull, which will be in every way up to date. One special feature will be the provision made for drying timber. They are adopting the latest American system of kiln—a most important matter in connection with all high-class woodwork. Shrinkage is practically obviated by this method. With the additional mill accommodation they hope to keep pace with their increasing business. They are now supplying what they describe as their "sesame" doors. Mouldings are worked on the solid, grooved and tongued to receive panels and rails, &c. This is a great departure from the usual method of construction, and has been already highly approved by leading architects. The system has been for years largely adopted on the Continent.

The firm have now in the press their new moulding book of special designs, which it is intended shall be in the forefront of such publications.

MESSRS. JOHN HALL & Co., of Stourbridge, inform us that they supplied the bulk of the glazed bricks used in the construction of the Blackwall Tunnel.

THE new union infirmary, Portsmouth, is being warmed and ventilated throughout by means of Shorland's patent Manchester stoves with descending smoke-flues and patent Manchester grates.

THE Jubilee screen that Messrs. Graham & Banks have now on exhibition at their well-known showrooms, 445 Oxford Street, will form in years to come an excellent record of the long reign of Her Majesty Queen Victoria. The first panel represents the "Coronation" in Westminster Abbey, showing Her Majesty on the throne surrounded by her subjects at the moment when the vast building rang with cheers and cries of "God save the Queen." Not only has the handsome Gothic stonework of the old Abbey been introduced into the background of the picture, but the costumes of the figures are correct in every detail both as to colour as well as to form, having been taken from authentic sketches and notes at the time. The "Marriage," which forms the second panel, represents the interior of St. James's Palace, when again the exact colouring has been kept to. The next panel, being the '51 Exhibition with its glass roof, makes a pleasant contrast to the old time-worn architecture of the Abbey, which repeats again on the end panel when Her Majesty and the Prince of Wales each are portrayed at the ceremony of the Jubilee of 1887. The screen is decorated in gold and colours is made of leather, and has four leaves.

## BUILDING AND BUILDERS.

THE memorial-stones for schools in connection with the church which is shortly to be erected in Ipsley Street, Redditch, took place on May 25.

THE foundation-stone of new premises for the York Dispensary has been laid by the Lord Mayor of the city.

THE foundation-stone of the Westminster Theological College, Cambridge, was laid on May 25. The site of the new building is near the junction of the Queen's and Madingley Roads.

ESTIMATES and DESIGNS for JUBILEE DECORATIONS submitted free of charge.

THE committee of the Congregational Chapel Building Society for Lancashire and Cheshire have voted a grant of 400*l.* towards the erection of a school-chapel in the Fulwood district of Preston; also a grant of 250*l.* and a loan of 150*l.* for the erection of a new chapel at Poulton-le-Fylde.

THE Princess of Wales has signified her intention of being present to-day (Friday), when the ceremony of laying the foundation-stone of the new hospital in the City Road will be performed by the Prince of Wales.

AT Wednesbury 1,345*l.* 6*s.* has been received towards the establishment of a nurses' institute. The heirs of Parkes have generously agreed to let the committee have an excellent site in Walsall Road, opposite the park, for the sum of 119*l.* (half its actual value), and 1,150*l.* is to be set apart for the building and contingencies.

### ELECTRIC NOTES.

EDISON'S latest idea, on which he is now said to be engaged in making experiments, is the reproduction of theatrical performances without the instrumentality of manager or actor. The great inventor's idea is so to improve the phonograph and the Kinetoscope that they will reproduce with absolute fidelity. In the case of the former the chief difficulty was in overcoming "the metallic character of the tone of the phonograph and the change of its timbre to that of the human voice, so that all the modulations of the singers and actors could be exactly reproduced and the synchronisation of the phonograph with the kinetoscope reproduction."

THE electric lamps erected in three of the principal places of the city of Manchester were brought into use for the first time on the night of May 20. The ceremony of switching on the current was performed by the Lord Mayor, and was preceded by a little dinner party at the Town Hall. In all, the new lamps number twenty, of which twelve are in Albert Square, two in St. Ann's Square and six in Piccadilly, and it is understood that they will displace about seventy-five large gas lamps. The new lamps are arc lamps of the usual description, fixed on lofty standards, designed, it is understood, to insure that they shall be in keeping with their surroundings. Each lamp is said to have an illuminating power equal to that of 3,000 candles. If the use of the lamps should give satisfaction, as it seems likely to do, and the cost is not too great, the

electric light will probably be brought into use ere long in some of the other central places of the city; but as to this nothing has yet been decided.

### NEW ISSUE.

THE prospectus appears this week (and will be found in our advertisement columns) of Messrs. Fisher, Son & Hartland, of Paradise Street, West Bromwich, with which is incorporated the Garter Foundry Company, also of West Bromwich. The company, which will henceforth be known as Fisher, Son & Hartland, Limited, has a registered capital of 25,000*l.* The business of W. Fisher & Son was established upwards of forty years ago for the manufacture of furniture and interior fittings of elementary and technical schools, churches and Government and public buildings, and general office furniture of all kinds; while the Garter Foundry Company has been established upwards of a quarter of a century for the manufacture of castings of every description, and it is anticipated that the combination of the two businesses will be productive of great economy in working, and will be eventually advantageous to both concerns. The board of directors, which is a strong one, consists of Alderman John Horton Blades, J.P., Councillor Heywood Hartland, J.P., Mr. Walter Waring and Mr. Fred. H. Fisher, the latter of whom has entered into an agreement to act as managing director for a period of five years. As the old firms have more orders on hand than they are able to cope with, more machinery, extended premises and extra working capital are required, and it is with this object that the present issue is being made.

### VARIETIES.

THE opening of a new English Presbyterian chapel at Portmadoc took place on May 22. The edifice was erected at a cost of about 2,400*l.*, the architect being Mr. Taliesin Rees, Birkenhead, and the contractor Mr. Evan Jones, Groeslon.

A CHURCH which has been erected by the Swedenborgian communion of Blackburn upon the site of an old edifice in Anvil Street is now open. The church, which is of free Gothic design, will accommodate about 250 worshippers, and has cost 2,250*l.*

# EWART'S COPPER "CROWN" VENTILATOR

FACTORY—346, 348, 350 EUSTON RD.,  
LONDON, N.W.

A TABLET has just been erected in Canterbury Cathedral bearing the names of all the archbishops of the Southern Province from Augustin in 597 to Frederick Temple in 1896.

DURING a thunderstorm which visited France last week, a church at Feysin (Isère) was struck by lightning. The building immediately caught fire, and was completely destroyed.

THE corner-stone of the new tower and spire which are to be added to St. Augustine's Church, Kilburn, were laid on the 13th inst. When completed the tower and spire will be among the loftiest in London.

A NEW city hospital is to be erected at Colington Mains, Edinburgh, and the first sod was cut on the 14th inst. The new hospital, which is to be on the pavilion system, will accommodate 600 beds—320 of them for fever patients—and the cost will be 240,000*l.*, or 400*l.* per bed, exclusive of site and approaches.

THE works in connection with the new Roman Catholic Cathedral at Westminster are making progress and will, it is hoped, be completed within two years. The foundations have been finished—at a cost of 15,000*l.*—and the granite façade is gradually mounting.

NEW schools were opened in Benacre Street, Birmingham, on May 24, in connection with Bristol Road Wesleyan chapel. The schools are part of a general extension scheme which includes the modernising of Bristol Road chapel, the liquidation of a debt of 1,000*l.* on Harborne chapel and school, and the purchase of a site and the building of a church at King's Norton. The cost of the whole scheme is estimated at 7,750*l.*

BY command of the Queen a window of elaborate design has just been placed in the parish church of Crathie, in memory of the late Prince Henry of Battenberg. The work represents an angelic figure rising from the sea. At the base are displayed the arms of the late Prince, and an inscription as follows:—"To the dear memory of Henry Maurice, Prince of Battenberg," and a text, "The Lord gave, and the Lord hath taken away. Blessed be the name of the Lord."

AT Bootle a fire broke out in one of a block of seven cotton warehouses, the property of the Liverpool Warehousing Company, Bootle, containing 4,000 bales of cotton. The flames were not extinguished until midnight, and the damage is estimated at 16,000*l.*

HENGRAVE HALL, near Bury St. Edmunds, with its 4,600 acres of splendid sporting land, has been sold by the executors

of the late Mr. John Lysaght to Mr. J. Wood, of Whitfield, Derbyshire, and of Ivington, Herefordshire. Hengrave Hall is famous amongst archaeologists as the finest example of Tudor architecture in the country. The building is of stone, and possesses some very fine ornamental carving. Messrs. Hampton & Sons, of 1 Cockspur Street, were the agents who effected the sale.

MESSRS. C. & E. LAYTON announce that they will in June publish a book by that well-known authority on theatres, Mr. Edwin O. Sachs, F.S.S., author of "Modern Opera Houses and Theatres," &c., entitled "Fires and Public Entertainments: a Study of some 1,100 Notable Fires at Theatres, Music Halls, Circus Buildings and Temporary Structures during the last 100 Years."

ST. CLEMENT'S CHURCH, Leigh, Essex, was struck by lightning on Tuesday last. The turret and belfry were entirely wrecked, and the church was filled with smoke. The clock was demolished, and the *débris* blocks the steeple stairs. Three large stained-glass windows were smashed. The damage is estimated at 1,000*l.*

BATT'S HOTEL, Dover Street, has been recently undergoing extensive alteration and renovation. In place of a stable and other outbuildings in the rear, a dining-room, kitchen and service-rooms have been built, making an important addition to the accommodation of the hotel. Messrs. Hilder & Edge, of Great Pulteney Street, have carried out this work, including the redecoration of the whole of the building. The following specialists have also been employed:—Messrs. Smith & Stevens have supplied passenger and dinner lifts; Messrs. Dent & Hellyer have fitted up entirely new sanitary fittings throughout, and have laid a new system of drainage; electric lighting has been installed by Messrs. Laing, Wharton & Down; electric bells and telephones by Mr. C. E. Zimdars, and hot water, cooking and heating apparatus by Messrs. Charles Heap & Co.

THE memorial-stone erected by Sir Walter Scott over the grave of Helen Walker, the prototype of Jeanie Deans, in the churchyard of Irongray, near Dumfries, has been seriously injured by visitors, who have chipped off numerous pieces to carry away as relics. The edges of the stone itself—which is of the flat "table" pattern—have been much disfigured in this way, and part of the mouldings on the short supporting columns have also been broken off. It is suggested that an enclosing railing should be erected by heritors of the parish or others interested in the preservation of the monument.

Architects are invited to visit our Workshops and inspect their work in  
course of manufacture.

445 OXFORD STREET, LONDON, W.

WHILE some labourers were laying out a lawn at New Villa, Balcombe, they unearthed a metal vessel containing twelve gold and 242 silver coins of the reign of King Edward III. The vessel containing the coins was in shape like a wine-flagon, and had a spout. Of the three legs it originally had, two were intact, while the third and missing one was found close by. The vessel, with its contents, weighed about 7 lb.

### ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

THE annual meeting of the Incorporated Association of Municipal and County Engineers was held in the Rochdale Town Hall on May 22. About 100 members were present from Lancashire, Cheshire and other counties. The mayor of Rochdale (Mr. John Turner) received the visitors, and gave them a cordial welcome to Rochdale. A large number of the engineers first visited the sanitary works, and inspected the new destructors, &c. Mr. May, borough surveyor of Brighton, presided.

### THE EMPIRE, WOLVERHAMPTON.

THE Empire Music Hall and Vaults, which are situated in Cheapside and Queen Square, being old and inconvenient, it has been decided to take them down and erect a first-class place of entertainment replete with every modern convenience. The new building will be designed by an architect of well-known ability, and the scheme will include the shop adjoining the Empire Vaults, together with some old shopping at the rear and a shop in Cheapside. The front of the hall will be in Queen Square, where a restaurant will take the place of the vaults. The front will be of red brick with terra-cotta facings, the ground floor of granite, and the woodwork of mahogany, and it is estimated that the entire cost will amount to between 40,000*l.* and 50,000*l.*

### NEW CATALOGUES.

MESSRS. MERRYWEATHER have chosen an appropriate time for the issue of their new catalogue of garden watering apparatus, garden hose and fittings, fountains, sprinklers, &c., with abridged list of pumps and water-supply plant for mansions, estates, nurseries, plantations, &c. It contains

illustrations of every description of plain and armoured hose, hose fittings, spreaders and lawn fountains, syringes, hose reels, &c. The illustrations are for the most part from photographs, and depict the actual working of the various appliances, of which the prices are explicitly given. Descriptions are also given of the firm's improved cottage and farm pumps, gas and oil power pumps, "Farm Homestead" pump, windmills and pumps, and "Garden Valiant" engine.

### CORRESPONDENCE.

#### Exits from Buildings.

SIR,—The letter under the above heading which you publish from Mr. Henry Cunliffe calls attention to a matter which I have been trying to get remedied for a long time past; but I am not prepared to go so far as Mr. Cunliffe, and to say that the danger in all places of amusement and of worship is so great that we must give up visiting such buildings. As regards churches your correspondent is undoubtedly correct. One or two narrow doorways are usually all the exits provided for a large congregation, and should a fire break out it is practically certain that there would be a crush at the doors, and many people would probably lose their lives in the panic. The organ loft is a dangerous place in most churches, and the heating apparatus is in the winter at any time liable to set fire to the adjoining woodwork. Every church should be fitted with some form of fire-extinguishing apparatus, and the exits should also be improved.

As regards theatres, the County Council has done a great deal in regard to exits, but I must say that, in London at any rate, the gallery and pit entrances and exits of a number of our older theatres are very unsafe. Winding, narrow staircases are the rule rather than the exception, and though proper exit doors lead into the street, yet in case of fire the crush is likely to occur on the staircases with disastrous results. It would be a simple matter to arrange that in each town the fire brigade officers, or a competent fire inspector, should examine the places of worship and also the theatres and other public buildings, and report to the authorities as to their safety in case of fire, and until this is done I do not think that any governing body will find anyone among their own officials capable of properly advising them in the matter.—I am, sir, yours faithfully,

Greenwich: May 26, 1897.

PRICE LIST AND ESTIMATES ON APPLICATION

**BERKELEY HOTEL, PICCADILLY.**

ON the 12th inst. this hotel and restaurant was reopened to the public, having been closed since the beginning of December last. During this interval extensive structural alterations have been made in the old portion of the building, and a new portion, seven storeys in height and covering the site of 73 and 74 Piccadilly, has been added. In the old portion the improvements include the enlargement of the restaurant by removing main walls on the ground floor, a rearrangement of the basement offices, the introduction of an electric passenger lift and complete redecoration. In the new portion an entrance hall to the restaurant, a spacious lounge and cloak-rooms have been provided on the ground floor, and suites of rooms, including reception, bed and dressing-rooms, with bath-room, &c., on each upper floor. The whole of the basement of the new portion is occupied by kitchens, larders and service-rooms.

The architectural treatment of the exterior was limited to a reproduction of the details of the old building, a stone portico to the restaurant entrance in Piccadilly being the only new feature.

The constructional steelwork and some intricate shoring were designed by Messrs. Reade & Reilly. The preliminary works and foundations were carried out by Mr. T. Stevens, of South Molton Street. The general contractors were Messrs. Kirk & Randall, of Woolwich, who, commencing at the beginning of the year, have carried out and completed the whole of the work in the remarkably short period of five months.

The whole of the heating and the cooking apparatus and hot-water supplies are worked from two 6 horse-power nominal vertical boilers. These boilers are very compactly arranged, as owing to the great difficulties in providing a proper boiler-house the space occupied by the boilers was a great consideration. By the arrangement of the valves either boiler can be used separately or both together, so that if at any time one of the boilers requires cleaning out, the working of the apparatus is not interfered with. The safety-valves on the boilers are adjusted to blow off at 60 lbs. pressure, but as this pressure is not required for the heating and cooking apparatus, special valves are provided on the mains supplying this apparatus to reduce the working pressure to 10 lbs. For the hot-water supply, steam from the boilers passes into a patent calorifier with an automatic attachment which regulates the supply of steam, so that the hot water in the storage cylinder is always a little under boiling-point. This calorifier is capable of furnish-

ing a supply of over 1,000 gallons of hot water per hour. The various heating arrangements, consisting of radiators and coils throughout the new and old building on staircases and landings, are also supplied by steam from the same boilers. The kitchen has been entirely reconstructed, and is fitted up with the following apparatus:—Central range and fire grill, by Cabain, of Paris; large roasting range; small roasting range, with spit driven by electric motor; large steam hot plate, 12 feet long; steam hot table, bain marie, vegetable steamer, beef boiler, steam hot closets, gas salamanders, &c.

The whole arrangement of the kitchen was set out by Messrs. Strode & Co. and fitted up by them, as well as the various tables, shelves, cupboards, ice safe, sinks, &c. The tables are constructed of 2-inch sycamore tops, with 5-inch birch turned legs, and the whole of this work is fitted up in a most substantial style. Provision against any accident by fire is amply provided for. On each floor are fitted two fire hydrants of bright polished gun-metal, with long lengths of hose, mounted on handsome polished mahogany boards, ready for immediate use in any emergency. Mains, 4 inches in diameter inside, are fitted up each side of the building for the water-supply to these hydrants. The cold-water supply has been entirely rearranged. For the main storage of water two 1,000-gallon tanks are fixed in the roof; these are also connected to other tanks in different parts of the building, so that scarcity of water is not likely to be known. The electric lighting, which is one of the most important features in a large establishment like the Berkeley Hotel, is effectively carried out by Messrs. Strode & Co. Throughout the building they have installed nearly 1,000 lamps, and have designed and manufactured the whole of the very elegant fittings. Those in the restaurant and entrance-hall are Jacobean in style, made in polished iron. The reception-room is fitted with very handsome Louis XIV. gilt candle sconces. The lighting of the sitting-rooms is most tastefully arranged, with handsome shade lights fitted in the centre of the rooms and polished brass brackets and standards for side lights. The adjustable fittings in the bedrooms, and the other fittings in the various other rooms, are all in keeping with the style of the building. The kitchen and basement are fitted in the patent interior conduit system, the same as fitted by Messrs. Strode & Co. at various hotels. By this system the cables and wires are perfectly protected against all kinds of mechanical injury, dampness, &c. The Hotel Company is not going to be less loyal than its neighbours, and have entrusted Messrs. Strode &

Co. to carry out the illuminations for Commemoration Day, which will consist of one of their patent devices representing a royal crown about 10 feet high, with an imposing arrangement forming festoons of coloured balloons, all illuminated by means of electricity.

The fireproof floors were executed by Messrs. Dennett & Ingle; the decoration of the restaurant and entrance by Messrs. Waring; the passenger and service lifts by the Otis Elevator Company; the electric bells and telephones by Messrs. Jackson & Coleby; the plumbing, drainage and sanitary fittings by Messrs. Dent & Hellyer; and the new furniture by Messrs. Marris, King & Norton, of Birmingham.

Mr. May, who represented Messrs. Kirk & Randall, and Mr. T. S. Inglis, the clerk of works, have by their constant and indefatigable attention assisted greatly in the satisfactory completion of the work within the time named.

### OPEN SPACES.

A PAPER was read by Sir Robert Hunter at the meeting of the Royal Statistical Society on the 25th inst. on "The Movements for the Enclosure and Preservation of Open Lands." Sir R. Hunter remarked that the hedges which were now typical of an English landscape were in the main of modern creation. The early agricultural settlement of the country was based on a system of common farming, which precluded permanent enclosure. The first step in the movement for the enclosure of common lands was the passing of the Statutes of Merton and Westminster the Second, in the reigns of Henry III. and Edward I., but it seemed unlikely that there was any general change in the agricultural system of the country until the War of the Roses ended. The desire to grow wool for home and foreign manufacture produced the agrarian revolution of the sixteenth century. Landowners endeavoured to convert the arable fields of the village into grass land, and the means employed were harsh and oppressive. During the seventeenth century a few enclosures were made by the aid of the Court of Chancery and by the sale of Crown rights, but the eighteenth century saw the first serious attack upon commons and common fields. The first private enclosure Act was passed in 1709. During the next forty years more than 1,600 private Acts were passed, and during the whole century nearly 3,000,000 acres was enclosed. In 1845 the Enclosure Com-

mission was constituted, and between that year and 1869 a further area of 618,000 acres was enclosed. There was difficulty in estimating the extent of common land remaining, two Parliamentary returns differing by 800,000 acres. The average amount of common fields still left was insignificant. The counter-movement for the preservation of open spaces originated in 1864 in a desire to preserve suburban (mainly metropolitan) commons. The Commons Preservation Society was founded in 1865, and a long course of litigation, conducted under the guidance of the Society, defeated the claims of lords of manors to enclose under the statute of Merton. In 1869 Mr. Fawcett stopped the enclosure of rural commons, and in 1876 the Commissioners were directed by the Commons Act of that year to favour regulation of commons as opposed to enclosure. After referring to Miss Octavia Hill's assistance in the preservation of open spaces, Sir R. Hunter stated that by these means, and by the regulation of commons, an area of 3,686 acres of open space had been secured within the county of London during the last thirty years, while in the metropolitan police district outside the county a similar area of 10,293 acres had been placed at the public disposal. If the Royal parks were added, London was in possession of 4,935 acres within the county and nearly 14,000 outside the county, but within the metropolitan police district. In the provinces, so far as could be ascertained from a return obtained from a number of towns of more than 6,000 inhabitants, nearly 12,000 acres of common land, park and garden had been secured to the public during the present reign, and probably during the last thirty years.

**WHITSUNTIDE ON THE CONTINENT.**—For the convenience of visitors to Brussels Exhibition, cheap tickets available for a week will be issued *viâ* Harwich and Antwerp. The Great Eastern Railway Company's Brussels service has been accelerated, and passengers leaving London in the evening and the North and Midlands in the afternoon reach Brussels next morning after a comfortable night's rest on board the steamer. For visiting the Hague, Amsterdam and other parts of Holland, the Rhine, North and South Germany and Bâle for Switzerland special facilities are offered *viâ* the Company's Harwich-Hook of Holland route, through corridor carriages being run to Amsterdam, Berlin, Cologne and Bâle from the Hook of Holland. The General Steam Navigation Company's fast passenger steamers *Peregrine* and *Seamew* will leave Harwich on June 2 and 5 for Hamburg, returning June 6 and 9.

## THE COUNTY COUNCIL WORKS DEPARTMENT.

IN addition to the half-yearly return of works completed by the Works Department of the London County Council up to September last, which exhibits a loss of 7,557*l.*, a further return has just been presented by the works committee, in which they submit the cost of several completed works for which the accounts have not been presented to the Council.

The return has been prepared in accordance with a resolution the Council passed on April 13 at the instance of Lord Onslow, instructing the committee to bring up an account at the earliest moment of works completed within the last half-year.

The first table in the return deals with fourteen estimated works, seven of which have been completed and certified, whilst the remaining seven have been completed and the accounts sent to the supervising officers, but have not yet been certified. On the seven works certified no very large deficiencies are disclosed, whilst in five cases the work has been completed below the revised estimate. Among the works which have been completed, but not as yet certified, two or three show very large and serious deficiencies. The most important of these is the work on the foundations at the new County Asylum at Bexley. The revised estimate for this work as undertaken by the department was 31,833*l.*, whilst the actual cost has been 37,578*l.*, showing an excess of cost over estimate of 5,745*l.* Mr. Adams, the manager of the Works Department, reporting upon the causes of this large excess, points out that in the actual cost 550*l.* has been included which is the amount paid to the local authorities for repairs to roads and which has yet to be added to the revised estimate. He says that this is another case of work having been accepted under a schedule of prices far too low. The preliminaries were not priced as they should have been, but a lump sum of 300*l.* was put down for the clerk of works' office and men's conveniences, whereas the actual value, as he estimated it, was some 1,000*l.* more. The preliminaries omitted were such as planking and strutting, which cost some hundreds of pounds, water for works, formation of road costing 984*l.*, and temporary buildings. As to prices, they were many of them very inadequate. The digging generally summed up to about 2,000*l.* below what would be a fair average price. Brickwork was the cause of 1,300*l.* excess. The way in which the works were hurried also tended to increase the expenditure considerably.

The work on the Vauxhall temporary bridge piers, the revised estimate for which amounted to 10,832*l.*, has actually cost approximately 12,590*l.*, or an excess of 1,758*l.* There is an excess of cost over estimate of 97*l.* on some paving works at the central dépôt, Belvedere Road, estimated to cost 1,583*l.* Another large excess is shown on the Wandle branch sewer, the work in connection with which was estimated to cost 9,670*l.*, whilst the actual cost was 11,873*l.*, showing an excess cost of 2,203*l.* The manager of the department, in his report upon this case, states that all the persons connected with the work who could afford any explanation of the excess in cost had left the service of the Council, and he was only able to judge of the reasons for the excess from an examination of the documents available. The cause appeared to be due in a great measure to the extremely low prices accepted by the department. For instance, excavation in tunnel, including carting away soil, timbering, and all risks, was allowed at the rate of 7*s.* 6*d.* per cubic yard. The average price for the Hackney and Holloway Fleet storm relief and Lewisham sewers was 18*s.* per cubic yard, and the average price for excavation in tunnel for sewer works, for which contractors tendered about the beginning of this year was 17*s.* 4*d.* per cubic yard. The lowness of the price at which this class of work was accepted accounted for a large proportion of the excess. The revised estimate for the whole of the fourteen works shown in this table amounted to 61,701*l.*, whilst the actual cost was 70,782*l.*, or an excess of cost over estimate of 9,081*l.* The amount of actual cost here given includes charges for plant and 6 per cent. for establishment charges.

In a further table at the end of the return the committee submit a list of nine estimated works which are completed or nearly finished, and accounts for which are in the course of preparation. Here again some large and important deficiencies are disclosed. The Camberwell Coroner's Court, for which the approximate amount of revised estimate was 2,430*l.*, has cost 2,872*l.* For work on new offices and fittings at the central dépôt the department accepted an estimate of 12,400*l.* under a schedule of prices, but the work has cost 14,579*l.* One of the superstructures in the Boundary Street area, estimated at 28,168*l.*, has cost 29,140*l.* A wall connected with the Boundary Street work was estimated at 527*l.*, but has cost 797*l.* The largest deficiency is shown in the Fulham sewer work, which was estimated to cost 21,560*l.*, but actually cost 29,151*l.*, or an excess over estimate of 7,591*l.* On the Whitefriars Fire Station, which was estimated to cost 20,725*l.*, there is an excess of 890*l.* The cost of these last two works is only approximate, as they are not yet entirely completed. On the other side of the account there has been a saving of about 500*l.* on the work on the central laundry at

Boundary Street, and of between 700*l.* and 800*l.* on some temporary road work at Boundary Street, the latter work not yet being completed. For these nine works the balance of excess over estimate amounts to 10,811*l.*, which, added to the excess given on the works in the other table of 9,081*l.*, shows the total excess of cost over estimate on these twenty-three works to have been 19,892*l.* If to this be added the excess of 7,557*l.* disclosed in the previous return, it will be seen that the total loss or excess of cost over estimate during the past year has been 27,449*l.*

On the other hand, a return of the jobbing works completed by the Department during the year ended March 31, 1897, shows that the schedule value of the work was 26,658*l.*, and the actual cost 24,284*l.*, a saving of 2,374*l.*

At the ordinary meeting of the County Council this week the reports were considered. Sir A. Arnold admitted that the position of the contractors in London in regard to the Council was not at present the most advantageous to the service of the public, and one of the main foundations of the report was a desire that there should be a rectification in that respect. He was not in favour of a large undertaking of architectural works by the department, but he was there that day especially to warn the Council not to deprive itself at this juncture, and whilst its relations with contractors remained as at present, of the means of carrying out any work at all.

Lord Onslow, in moving that no further work should be entrusted to the Works Department, said it was agreed on all hands that a body consisting for the most part of amateurs, who had many other avocations to pursue, could not give the time necessary for the conduct of a vast contractor's work. The reason of the failure of the department was its anxiety and greed to grab every sort of work so that it should not fall into the hands of contractors. They had been told that in order to make the department a success it was necessary to have a large turnover—he thought 240,000*l.*—in order to keep down establishment charges. A large turnover was an excellent thing when they were making a profit, but it was a disastrous thing when they were making none. They had spent upwards of 100,000*l.* on their works at Belvedere Road in order to have carpenters and joiners, and their expert told them that he had never seen such infamous joinery as that done by the Council. The department had been exceptionally favoured; it had been allowed to pick its jobs, it had made no bad debts, it had large discounts for cash, it required no capital to pay its workmen, it had unlimited power to borrow, and the result had been nothing but indifferent work, falsification of accounts and a ruinous cost to the ratepayers. If there had been any saving made by the department it would have justified its existence, but, on the contrary, it had been a lamentable failure.

After some discussion it was decided that the debate should be resumed at a special meeting to be held on Friday (to-day).

## HUDDERSFIELD SEWAGE WORKS.

QUITE recently a Belgian deputation inspected the Huddersfield Sewage Works, says the *Telegraph*, and on their departure registered in the visitors' book their impression of what they had seen in the terms, "A perfect installation, deserving of commendation." Making full allowance for continental politeness, such a declaration cannot well be shorn of its full significance, especially when it is remembered that the deputation were accompanied by an Englishman of high reputation in Belgium and parts of France as an authority on works of this description. Since the amount of capital expended on this installation reaches no less than 102,000*l.* odd—apart from interest, maintenance charges and cost of working, making an annual call of from 10,000*l.* to 12,000*l.* on revenue account—the ratepayers might naturally be pardoned the expected possession of a valuable asset in the form of appliances fairly competent to achieve the objects sought. On that point they may take it for granted that there exists little need for dissatisfaction. At any rate this much may be stated, that if the works are not equal in respect of extent, and consequently of absolute adequacy, to the ideal set up by the West Riding Conservancy Board in relation to the prevention of rivers pollution, they are nevertheless capable, in the measure of their dimensions, of attaining the purposes for which they have been constructed and equipped. When storm waters, domestic and manufacturing sewage are so manipulated as to eventually result in an effluent which may be without apprehension taken for human consumption, and a water actually brighter in colour than that supplied to the inhabitants for drinking purposes, merely retaining to the palate the flavour of the precipitating medium with which it has been treated, it may be fairly claimed that the main objects sought have been secured to a demonstration. This dictum is one which could not fail to be adopted by any impartial visitor, just as it is one which has often been uttered by experts, who have not only been delighted with the scientific equipment of

the works, but also with the attractive environment by which the various processes have been surrounded.

A glimpse of the works, which were designed by Mr. R. S. Dugdale, C.E., the borough surveyor, from any suitable point—say, from the Deighton branch of the London and North-Western Railway—is one which elicits no little surprise, because of the striking natural features of the situation, as well as the charming *ensemble* presented to view. Pretty as the picture now undoubtedly is, having in mind the purely utilitarian character of the undertaking, it must not be overlooked that existing arrangements only followed upon technical preliminaries of an exacting kind, in the form of appropriate design, laying out of the land, the building of nearly a mile of retaining wall to river and canal, extensive culverting, the construction of filter-beds and tanks, and other work of a costly description, all of which should not be overlooked in any attempt to estimate the undoubtedly high position which the works, in the opinion of sanitary engineers, now occupies. Accompanied by Mr. Greenwood, the manager, a tolerably accurate idea of the capabilities of the undertaking may be readily obtained. The works are entered close to Woodhouse Mills, Deighton, where the industrial enterprise carried on by the present mayor (Alderman J. Lee Walker) and the profit-sharing scheme, successfully inaugurated and worked by Mr. George Thompson, J.P., are both in operation. Access to the gates is obtained either from Ashgrove Road or Woodlands Road, running off at different angles from Leeds Road, both of which are boulevarded after the manner very properly adopted in Huddersfield of late in the case of many outlying roadways. Along Ashgrove Road run tram-lines, by which domestic refuse may be conveyed to the works for cremation by the destructors so soon as these agents of sanitation have been brought into effective operation in this part of the borough—a consummation shortly anticipated by the authorities.

Passing the entrance gates, on the left is found the weighing-office and on the right the valve chamber, fitted with sluices by which the entrance of sewage and of storm water may be controlled. The volume now impossible of treatment is turned back into the river. While from  $7\frac{1}{2}$  to 8 million gallons of sewage are daily presented from the town sewers, only about half that quantity can be dealt with. The authorities are adopting measures to limit the quantity of liquid matter offered them, and with this object they are endeavouring to arrange that clean water streams shall not enter the sewers at all, and that manufacturers shall provide at their respective mills tanks where matter in suspension may be deposited before the liquid is finally carried away by means of the town sewers. Even then extension of the sewage works will be called for, and it was in this view of the contingency that the Whitehouse Farm, lying at the foot of Dalton Bank, was recently acquired at a cost of 5,000*l.*

From the valve chamber where the town's sewage enters the works the distance between that point and what may be described as the administrative buildings is occupied on the right by ornamental gardens which give a very neat appearance to the enclosure, and on the left by buildings containing what is technically known as the roughing tank or detritus where the solid matter is dredged from the sewage; and still further on the same side the refuse destructors, boilers, and a fine octagon chimney in brick rearing its shaft 90 yards above the surface and constituting the highest in the district save the one at Fieldhouse belonging to the Leeds Fire Clay Company. The set of structures on the left have trees trained up their walls, suggesting rather buildings associated with a fruit-growing establishment than a place of necessity of a slightly more unsavoury description. The buildings generally are of blue brick relieved by courses in stone, and the administrative section coming across at right angles is further relieved by a clock tower containing a useful timepiece which strikes the hours. A couple of boilers are now at work for driving 13 arc electric lamps of 1,000 and 1,500 candle-power, numerous incandescent lamps and the sludge presses, which deal with about 1,000 tons of matter per month. It is hoped that when got into effective operation the destructors will generate enough steam to keep the electric-lighting plant at work without any demand upon the boilers. From the valve chamber the sewage is culverted to the detritus tank, 125 feet in length, where a dredger made by Messrs. Thomas Broadbent & Sons, engineers, Huddersfield, lifts from the tank 50 tons per week of the more solid matter. This for the moment is being removed by neighbouring farmers for tillage purposes. Arrived at the end of the roughing tank, the floating matter, consisting largely of oil and refuse wool, is removed. Manufacturers would do well to themselves to utilise both for their own gain, and so secure the removal of articles which are no little source of dirt and trouble at the sewage works. The wool refuse, now amounting to about 6 cwt. per day, at one time totalled four times that quantity, and was reduced through the efforts of a sub-committee, who made such representations to millowners as to bring about the change now recorded. As it is, the works manager is able to boast of an excellent suit of clothes made

from such refuse wool, and other portions are being worked up for some such similar purpose.

The sewage now ready for treatment passes through a measuring wheel, whose capacity is 3,000 gallons per revolution, and is then treated with a precipitant known as ferozone, supplied by the International Water and Sewage Purification Company, London, who also are the makers of the polarite used in the filter-beds. The sewage, coming largely from mills, varies in colour and density almost hourly, and as certain coloured sewage requires the application of double the quantity of the precipitant to other kinds, the apparatus supplying it cannot be worked automatically, but has to be operated by hand to suit the exigencies of the moment. The action of the precipitant is easily observable when the process is conducted on a small scale in a testing glass. The sewage, first seen as dark, even-coloured liquid, having received its due quantity of ferozone, soon begins to break up. The dense matter coagulates, and quickly presents the aspect of a black snow-storm, whose flakes ere long fall to the bottom of the glass. It is whilst these dense particles are in suspension that the sewage passes under the administrative buildings in culverts, and divides right and left in order to reach the twenty-four settling tanks, a dozen on each side of the system, there laid out to view. From the tanks where the sludge is deposited it passes inwards to the filter-beds, and after filtration is carried along the length of the system in open troughs or aerating channels, to be delivered again close to the administrative buildings into a stream with a pebbly concreted bed and banks of brickwork, relieved by flowering shrubs and ferns, whence it leaves the works and enters, five furlongs further down, the river near the weir at Colne Bridge. So pretty is the aspect of the stream that the onlooker would be little more the subject of surprise if gold-fish or speckled trout were detected disporting themselves in the bright, clear water.

In one of the settling-tanks an experiment has been tried for the automatic removal of sludge, and so successful has it been that it must ere long be fitted to the remaining tanks. In the case of the twenty-three other tanks, sludge has at present to be removed by hand; the men, supplied for the purpose with fishermen's brogues and thick woollen jackets, having to descend to the sludge, and pass it out with the aid of suitable implements. The automatic arrangement is the monopoly of the International Company already referred to. The sludge afterwards reaches the press-room by gravitation, and here are four large presses operated by compressed air. By means of the presses about sixty per cent. of the moisture is removed, and the sludge-cake left is afterwards lifted by a hydraulic hoist to a convenient level, and then conveyed to a tip on the estate. The cake is worthless for manurial purposes, and is, when the destructors shall have been perfected, to be domestic refuse, and duly consumed. However, of the 55 acres of land comprising the estate, one even is not yet fully covered by the refuse tipped there. Present experience leaves the sludge-cake still an unknown quantity, and actual innocuousness to be obtained by crematorial agencies, it is considered, should be positively secured. The filtering medium consists of a number of layers of different character, composed respectively of rough stones and land tiles in the bottom, then smaller stones the size of peas, next rough sand, afterwards a 12-inch thickness of polarite and sand mixed in the proportions of six of polarite to four of sand, and on the uppermost strata a 4-inch bed of washed river sand obtained from the Tadcaster district. The works in general may be considered to have been pretty accurately detailed, when it is added that the buildings also include a mess-room for the employés, a fitter's shop, the manager's office, a handsome room for the meetings of the Corporation committee and the reception of deputations from other places, besides an engine-room containing a pair of horizontal engines, a couple of electric dynamos by Cromptons, of Chelmsford, and a brace of engines for compressing air for forcing the sludge through the presses. A round of the works constitutes a trial of no severe character to the most sensitive nasal organ, and it is stated that of the thirty-eight men employed there none has ever been a sufferer from any zymotic disorder.

### JOHN RAMSBOTTOM, C.E.

THE late Mr. John Ramsbottom, a distinguished engineer, who was for many years connected with the locomotive department of the London and North-Western Railway, died on the 20th inst. at his residence, Fernhill, Alderley Edge, Cheshire, in his eighty-third year. He became locomotive superintendent of the Manchester and Birmingham Railway in 1842, and when the London and North-Western absorbed that line in 1846 he remained as district superintendent of the north-eastern division. In 1857 he succeeded Mr. F. Trevithick at Crewe Works, and when in 1862 engines ceased to be built at Wolverton, he became locomotive superintendent of the whole line. From Crewe he turned out a large number of successful engines, both goods and passenger. The first of the well-known "Lady

of the Lake" class he produced in 1859, and how excellent was the general design of those engines may be judged from the fact that in the race to Scotland between the east and west coast routes in 1888, when a comparatively light load had to be drawn at high speed, some of them were employed to take the trains from London to Crewe, although they were then nearly thirty years old. The system of laying water-troughs between the rails, from which engines can pick up water when travelling at a high speed, was introduced by him on the North-Western, to which it was for long practically confined. Recently, however, it has been adopted by several other railways, and, indeed, the long runs without a stop which have come into vogue of late years would be all but impossible without these troughs. Mr. Ramsbottom was a member of the Institution of Civil Engineers and served as president of the Mechanical Engineers in 1870-71. He was also a director of the Lancashire and Yorkshire Railway.

### THE TORONTO MEETING OF THE BRITISH ASSOCIATION.

SINCE the previous announcement of the preparations for the Toronto meeting of the British Association the local executive committee have issued a large number of invitations to foreign scientific men, many of whom have accepted the invitation, and it is believed that in this respect the meeting will not fall behind any meeting held in the British Isles. American scientific men will be present in large numbers, and the interest felt in the United States is further indicated by the attendance of the presidents and members of the staffs of Clark and Johns Hopkins Universities and of the universities of Pennsylvania and Chicago. The Botanical Society of America, the American Association of Teaching Engineers, the American Mathematical Society, and probably also the Geological Society of America, will meet in Toronto on August 16 and 17 in order to enable their members subsequently to join the British Association and take part in its meeting.

The interest felt in Canada may be understood from the fact that nearly every Canadian public man will be present. It is fully realised there how important the coming occasion will be to the Colony, and especially at a time when efforts are being made to strengthen the ties with the Motherland. The Governor-General has taken a deep interest in the meeting, and will be present. His Excellency and Lady Aberdeen will

give a reception to the members of the Association in the new Legislative buildings. Another reception will be given by the Hon. G. A. Kirkpatrick, the Lieutenant-Governor of the Province, and Mrs. Kirkpatrick. It is arranged also to give a public banquet in honour of Lord Lister, Lord Kelvin, and the president-elect of the Association, Sir John Evans.

The arrangements with regard to all the excursions have been made more definite. The Canadian Pacific Railway Company, it is now ascertained, will give first-class return tickets from Toronto to the Pacific Coast for a rate varying between 61.80 dols. and 70.30 dols., according to the route selected, and the journey may be made at any time between July 1 and October 1. This rate is less than the single fare, and is that which is usually charged for a single ticket to Calgary, at the eastern edge of the Rockies. Local committees are now being organised to take charge of this and other excursion parties which will visit the various towns and localities in Canada.

The Muskoka district is one of the most beautiful localities in Canada. It contains a number of lakes of moderate size, all connected with each other and studded with innumerable islands of rocky formation, but for the most part covered with forest trees. On these islands are hotels, summer residences and camping-grounds for the large number who resort annually to this locality to enjoy cool weather and delightful scenery. It has been arranged that the excursion to this district shall take place on a Saturday, and the members will stay in groups on the Saturday night at various points in the district, while on the Sunday they will sail through the lakes and gather again at a central point for the return journey to Toronto on the Monday morning. The members who take part in this excursion will be the guests of the Muskoka Lakes Association and of the Muskoka Navigation Company. The fare for the railway journey from and back to Toronto will be a nominal one. The Cataract Construction Company (New York) of Niagara Falls has, through its President, extended a cordial invitation to the Association to visit its plant at Niagara Falls. The interest of the excursions to the Don Valley, which is within a few miles of Toronto, consists in the most remarkable drift deposits, in places more than 200 feet thick, the lowest bed, formed of boulder clay, resting directly on Silurian rocks. Interglacial series of sands and clays, holding many fossils of plants and animals belonging to a warmer climate than the present, are in evidence, while above are found two thick beds of glacial deposit. At the higher points, 170 feet above the present

lake level, the old shore line of the ancient "Iroquois Lake" is splendidly shown. The glacial and interglacial deposits of the Scarboro Heights, also within a few miles of Toronto, which are at one point as much as 350 feet thick, yield a very large number of extinct forms, especially beetles. The two localities may be seen in one day, and a party will inspect both under the guidance of Professor Coleman, who has made a special study of these glacial deposits.

It is arranged that the excursion party visiting the Niagara cañon along its course shall be under the direction of Mr. G. K. Gilbert, of the United States Geological Survey, and Dr. Spencer, who have given special attention to the geology of the Niagara district.

A handbook of Canada is in course of preparation which it is anticipated will be welcome to members who desire to inform themselves as to the Dominion before visiting it. To make this possible, it is intended that a sufficient number of copies shall be ready at the London office in July for distribution to all who intend to be present at the Toronto meeting. The book will contain chapters on the geography, geology, natural history and resources of the Dominion, as well as sketches of its history, administration and economics, and as these are being contributed by the chief Canadian authorities, the handbook will have more than a temporary value.

The Canadian Pacific and Grand Trunk Railway Companies have prepared for this season special tourists' guide-books for Canada, which will be sent from their English offices to all who apply for them.

### COMPLETION OF THE SOUTH KENSINGTON MUSEUM.

WE understand, says the *Times*, that Sir John Gorst's committee on the museums of the Science and Art Department have agreed upon an interim report drawing the attention of Parliament to the peril to which the priceless collection at South Kensington is exposed of destruction by fire. It is pointed out that the old buildings are constructed of wood and lath and plaster, covered in many instances with tarred felt, and that in the immediate proximity are temporary buildings constructed of fir covered with iron and lined with varnished matchboarding; yet, notwithstanding the obvious danger to the contents of the museum from such a state of things, to which attention has been called both in and out of Parliament, nothing has been

done to remedy it. The committee further state that the galleries containing important art collections are open to fire damage, and that the art schools are especially liable to the risk of fire, while the galleries themselves would easily fall a prey to fire. That these buildings have so long enjoyed immunity from fire is, in the opinion of the committee, due to the care and vigilance of the police, the skill and care of the various assistants and mechanics employed about the premises, and the unremitting watchfulness of the officials. The committee recommend the immediate completion of the buildings, and suggest that in the meantime the valuable collections should be withdrawn from exhibition rather than be longer exposed to risk of destruction.

### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

#### APPLICATIONS FOR PATENTS.

11715. William John Earl Henty, Henry Thomas Adams, and George Henry Soder, for "Improvements in apparatus for use in erecting buildings and other structures of concrete."

11558. James Frederick Bennett and Robert Henry Marples, for "Improvements in electrical gas-lighting apparatus."

11577. George Walter Westgath, for "A window-fastener."

11933. Peter Jenson, for "Improvements in fire grates."

11925. Herbert Coward, for "An improvement in the construction of fireproof floors."

11633. John Lawrence, for "A gully-trap and such invention to be applicable to all traps of any kind."

11990. Edward Louis Schacht, for "Improvements in door checks or door holders."

12025. Alfred Henry Hardaker, for an "An improved set square."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

# THE NEW EXPANDED METAL

Meshes from  $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to  $\frac{3}{16}$ th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

**THE EXPANDED METAL COMPANY, LTD.,**

**EDITORIAL NOTICES.**

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

**TENDERS, ETC.**

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

**NEW READING CASE.**

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

*For Advertisement Scale, see page xv.*

**COMPETITIONS OPEN.**

BOOTLE.—July 31.—Competitive plans are invited of a technical school to be erected at the corner of Balliol Road and Pembroke Road, at a cost not exceeding 15,000l. Premiums of 50, 30 and 20 guineas will be awarded for the designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. J. H. Farmer, town clerk, Town Hall, Bootle.

MORECAMBE.—Competitive designs are invited for the erection of a new hotel, to be called the Hôtel Métropole, at a cost of 30,000l., at this picturesquely situated and rapidly increasing fashionable seaside resort. Designs must be sent in under motto on or before June 16, 1897.

**CONTRACTS OPEN.**

ABERDEEN.—June 8.—For additions to offices at Flushing, Cairnbulg. Messrs. Jenkins & Marr, architects, 16 Bridge Street, Aberdeen.

ABERGAVENNY.—June 11.—For erection of two additional classrooms at Park Street Schools. Mr. E. A. Johnson, architect, Abergavenny.

ASHREIGNEY.—June 15.—For taking-down and reconstructing in timber the defective part of Kersham Bridge, over the river Taw. Mr. H. Masterton, county surveyor, Boutport Street, Barnstaple.

ASKAM-IN-FURNESS.—June 15.—For building a new classroom at the Ireleth School. Rev. J. A. Roberts, Ireleth Vicarage, Askam-in-Furness.

AYLESBURY.—June 9.—For repairs at the union house. Mr. Frederick B. Parrott, clerk, 16 Bourton Street, Aylesbury.

BALHAM.—June 8.—For erection of a branch library in Ramsden Road. Mr. Sydney R. J. Smith, architect, 14 and 15 York Buildings, Adelphi, W.C.

BARKING.—June 17.—For erection of retort-house, boiler-house, exhaustor-house and mess-room. Mr. W. North, Gasworks, Stourbridge.

BARROW.—June 12.—For erection of Barrow Beaconsfield Conservative Club, Abbey Road. Mr. John M'Intosh, architect, 6 Cornwallis Street, Barrow.

BEESTON.—For erection of four houses. Mr. W. H. Higginbottom, architect, King John's Chambers, Nottingham.

BELFAST.—June 10.—For erection of buildings at Donegall Square West and Wellington Place. Messrs. Stokes & Ferguson, 35 Royal Avenue.

BLAENAVON.—For alterations and additions to Wain Tavern. Mr. E. A. Johnson, architect, Abergavenny.

BRADFORD.—June 14.—For erection of a large block of shops and dwelling-houses and entrance archway in Manningham Lane. Messrs. Mawson & Hudson, architects, 2 Exchange Buildings, Bradford.

BRADFORD.—For erection of four through houses in Newark Street, off Wakefield Road. Mr. F. Moore, architect, 40 Sunbridge Road, Bradford.

BRADFORD.—For erection of four houses in West Bowling. Mr. W. H. Sharp, architect, 239 Rooley Lane, Bradford.

BRIGHTON.—June 15.—For alterations at Warren Farm Schools, Rottingdean. Mr. T. G. Gibbins, architect, Molesworth House, Palace Yard, Brighton.

BRISTOL.—June 9.—For completion of Kingswood Reformatory. Mr. H. C. M. Hirst, architect, 30 Broad Street, Bristol.

BRISTOL.—June 7.—For small job at Long Ashton Police Station. Mr. W. Rolfe, 14 George Street, Bath.

BUNNEY.—June 12.—For new roof to the north aisle of Bunney Church. Mr. Carver, churchwarden.

CANTERBURY.—For erection of chimney shaft foundations, setting and fixing of a new Cornish boiler, alterations to boiler-house, subway from boiler-house to new blocks, alterations to laundry and steward's stores, and additional works of sewage disposal, at Chartham Asylum, Chartham Downs. Mr. W. J. Jennings, architect, 4 St. Margaret Street, Canterbury.

CARLISLE.—For erection of Hayton Hall and reading-room. Mr. T. Taylor Scott, architect, 43 Lowther Street, Carlisle.

CORSHAM.—June 28.—For additions and alterations at Mansion House. Mr. Thomas Holloway, Chippenham, Wilts.

CORNWALL.—For erection of five-roomed dwelling-house at College Row, Camborne. Mr. E. Rogers, Trelowarren Street, Camborne.

DARLINGTON.—June 9.—For alterations and additions to Black Swan Hotel, Parkgate. Mr. W. Duncan, architect, 3 Zetland Road, Middlesbrough.

DEAL.—June 12.—For erection of a ladies cloakroom at end of South Parade, and for a shelter seat on the Marina. Mr. Thos. C. Golder, borough surveyor.

DEWSBURY.—June 17.—For erection of two cottage homes in Heald's Road. Messrs. Holtom & Fox, architects, Westgate, Dewsbury.

DUBLIN.—June 9.—For erecting nine labourers' dwellings. Mr. D. Morris, clerk of works, 24 Cabra Parade.

DURHAM.—June 8.—For pointing the boundary walls at Benfieldside Board Schools. Mr. G. T. Wilson, architect, 121 Durham Road, Blackhill.

EDENBRIDGE.—June 14.—For pulling-down old houses and erecting new houses and ironmonger's shop. Mr. Beale, surveyor, Madeira Park, Tunbridge Wells.

**BERRY, CAMPBELL & CO.**  
WARMING & VENTILATING ENGINEERS,  
62 WATLING STREET, QUEEN VICTORIA STREET.

Heating by Hot Water, or High or Low Pressure Steam, expeditiously carried out on the most approved principles. Special attention given to Private Residences.

ESTIMATES FREE.

EGHAM.—June 12.—For pulling-down and rebuilding part of the Catherine Wheel Hotel. Mr. William Menzies, Englefield Green, Surrey.

FEATHERSTALL.—For painting, &c., inside three houses. Mr. N. Shore, 2 James Street, Deanley, Littleborough.

FENTON.—June 15.—For construction of a brick culvert, about 125 yards in length, with manholes, &c. Mr. S. A. Goodall, surveyor, Town Hall, Fenton.

FOLKESTONE.—June 9.—For supply of desks and other apparatus to the new Board schools, Sidney Street. Mr. Ernest S. Wilks, architect, 2 Cheriton Place, Folkestone.

FOXFORD.—June 12.—For erection of a glebe house and offices, &c., at Foxford, co. Mayo. Mr. J. Gervais Skipton, architect, Northgate Street, Athlone.

GATESHEAD.—For erection of factory premises at the Teams. Mr. J. W. Roundthwaite, 13 Mosley Street, Newcastle-on-Tyne.

GLOUCESTER.—June 8.—For new works at the Gloucester Municipal Technical Schools, Brunswick Road. Messrs. Waller & Son, architects, 17 College Green, Gloucester.

GRIMSBY.—June 14.—For erection of Diamond Jubilee provident homes. Mr. Herbert C. Scaping, architect, Grimsby.

GUILDFORD.—June 11.—For erection of buildings to contain the carburetted water-gas apparatus, for the Guildford Gaslight and Coke Company. Mr. William Titley, secretary, Gas Offices, Guildford.

HALIFAX.—June 9.—For erection of three pairs of semi-detached villa residences at Savile Park. Mr. Medley Hall, architect, &c., 29 Northgate, Halifax.

HALIFAX.—June 17.—For erection of three pairs of semi-detached villa residences at Savile Park. Mr. Medley Hall, architect, &c., 29 Northgate, Halifax.

HAMPTON.—June 14.—For erection of shop and additions to bakery at Station Road. Mr. Geo. F. Duke, secretary, Station Road, Hampton.

HAMPTON.—June 25.—For construction of engine-house and other buildings on the site of sewage outfall works at Hampton-on-Thames. Mr. Isaac Shone, 47 Victoria Street, Westminster, S.W.

HIPPERHOLME.—June 10.—For erection of stabling for ten horses and cartshed. Messrs. Jackson & Fox, architects, 22 George Street, Halifax.

HORNCastle.—June 14.—For repair of five bridges, viz. three in the parish of Wispington, one in the parish of Thimbleby and one in the parish of Edlington. Mr. T. E. Chatterton, clerk, Horncastle.

ILKESTON.—For enlargement of the Primitive Methodist Chapel, Nottingham Road. Mr. Samuel Richards, architect, 3 Market Place, Ilkeston.

IRELAND.—June 8.—For erection of thirteen cottages for agricultural labourers. Mr. J. E. Sharkie, executive sanitary officer, Poor-Law Office, Strabane.

KENDAL.—June 10.—For erection of a dwelling-house, with detached business premises in the rear, on a plot of land in Sandes Avenue. Mr. Stephen Shaw, architect, Kendal.

LEEDS.—June 8.—For erection of new water-closets and additional lavatory accommodation at the Workhouse. Mr. Thomas Winn, architect, 90 Albion Street, Leeds.

LEEDS.—For erection of a house at Gipton, near Leeds. Mr. F. W. Rhodes, architect and surveyor, Upper Wortley.

LEEDS.—June 8.—For excavating storage cellars, &c. (about 3,500 yards cube), in York Street. Mr. W. S. Braithwaite, architect, 6 South Parade, Leeds.

LEEDS.—June 10.—For alteration of the exhaustor-house at the Meadow Lane Gasworks. Mr. R. H. Townsley, general superintendent, Municipal Buildings, Leeds.

LIVERPOOL.—June 24.—For erection of proposed new offices, North John Street, Liverpool, for the Royal Insurance Company. Mr. J. Francis Doyle, architect, 4 Harrington Street, Liverpool.

LONDON.—June 14.—For erection of a greenhouse at Irish Corner, Muswell Hill, 60 feet by 12 feet. Mr. E. J. Lovegrove, C.E., engineer to the Hornsey Urban District Council, 99 Southwood Lane, Highgate, N.

LONDON.—June 21.—For supply of internal fittings, fixtures and furniture required at the new Dulwich Library in Lordship Lane. Mr. C. William Tagg, vestry clerk, Vestry Hall, Camberwell, S.E.

MANCHESTER.—For rebuilding Jolly Butcher Inn, Bowlee. Mr. C. H. Openshaw, architect, Fleet Street, Bury.

MARYPORT.—June 12.—For erection of washhouses, &c., and back yards at Steer Cottages. Mr. C. F. Watson, Greysouthen, Cockermouth.

MELKSHAM.—June 9.—For erection of a Masonic Hall. Mr. John A. Randell, M.S.A., Exchange Place, Devizes.

**MESSRS. SPARROW & SON, NOTTINGHAM.**

WE recently had the pleasure of inspecting the admirably arranged showrooms of Messrs. Sparrow & Son, decorative artists, painters, gilders, glass and sign writers, ecclesiastical and general decorators, &c., of Park Row, Nottingham, and were much struck by the refinement and taste everywhere

evident. The photograph which we reproduce will give some idea, although an inadequate one, of their extent; in fact, they resemble art galleries rather than mere showrooms, while the goods displayed therein are seen to great advantage and emphatically demonstrate that the old firm, although established upwards of 130 years, instead of crystallising or resting contentedly on its reputation, is as elaborately up-to-date as the newest.

# ARMoured DOORS

## A STEEL SHEATHED WOODEN DOOR WHICH IS FIREPROOF.

ACCEPTED & RECOMMENDED by ALL INSURANCE CO.'S

WILL NOT BUCKLE  
OR WARP LIKE  
THE ORDINARY IRON  
DOORS.

CAN BE FITTED  
WITH AUTOMATIC  
SELF-CLOSING  
ATTACHMENT.

HAS STOOD THE MOST SEVERE TESTS IN THIS COUNTRY.  
FIRE AT THE WORKS OF THE ANAGLYPTA CO., DARWEN, LANCASHIRE.

The door we fitted in these works, although subjected to a heat intense enough to melt brass taps and fittings near it, withstood the heat perfectly, and can now be inspected at our works in Manchester, fit for duty. The metal sheets have expanded without becoming detached, whilst the wood is simply charred to a depth of about  $\frac{1}{8}$  of an inch.

## TRADE NOTES.

THE "Soho" cowl and ventilator, which is being put on the market by Mr. L. Nicklin, Despatch Works, High Park Road, Smethwick, can be confidently recommended as an efficient apparatus. It is the joint invention of Messrs. Nicklin & Milward, and possesses the advantages of simple construction, the absence of parts requiring oiling and the substitution of rivetting for soldering in the putting together, this last-named feature being regarded as a safeguard should the chimney catch fire. Another point is the introduction of a current of air at the back of the cowl, which, passing over the back of the fan-shaped shield, increases the suction in the head of the cowl and clears the main pipe of smoke, increasing the up-draught to a considerable extent, while offering resistance to down-draught. To further increase the up-draught, currents of air are introduced on each side of the cowl head acting under the fan-shaped shield, and add very materially to the suctional power of the cowl. The double vanes on the top of the cowl keep the head subservient to the action of the wind, adding very much to the efficiency of the cowl. By their action the wind currents have a direct pressure on both wings, keeping the head of the cowl in such a position that the wind rushing through the inlets greatly increases the draught. The main pipe being quite clear, the sweep's brush can pass without obstruction to the middle of the head of the cowl and thus clear the pipe of any soot that may have accumulated. The semicircular base for the pivot prevents the brush from displacing the head of the cowl and adds strength to the pivot by reducing its length—a matter of great consideration in stormy weather, as many cowls are rendered useless at such times by the pivot becoming bent and preventing the free revolution of the cowl. The pivot is fitted with an adjustable nut placed inside a lateral stay or bracket so fixed as to prevent the head of the cowl being blown off in the severest gale. The fan-shaped shield is claimed to be a great preventative of down

and back-draught, it being placed in the head of the cowl at an angle that directs the back-draught through the inlet at the rear and also through the side inlets, they being placed in a direct line with the mouth of the cowl. To entirely obviate the possibility of any smoke or down-draught entering the chimney itself, three outlets are placed in the lower part of the main shaft, as shown in illustration.

THE Cargo Schools, Carlisle, are being warmed and ventilated by means of Shorland's patent Manchester grates, patent exhaust roof ventilators and special vertical inlet tubes, by Messrs. E. H. Shorland & Brother, of Manchester.

MESSRS. WIDNELL & TROLLOPE, surveyors, have removed from 13 Parliament Street to Broad Sanctuary Chambers, Tothill Street, Westminster, S.W.

### LINCRUSTA-WALTON DECORATIONS.

MESSRS. FREDERICK WALTON & CO., of 2 Newman Street, W., send us some sketches of commemorative and other designs which they have recently got out for their well-known Lincrusta-

Walton decoration. Among the more strictly commemorative of these is the admirable portrait medallion of Her Majesty, of which we give an illustration. The size of this is 13 inches diameter, and it can be had decorated in various styles and

colourings at prices varying from 1s. to 3s. Other designs comprise the royal arms, the royal standard, the Prince of Wales's feathers, the badges of England and Scotland, &c., &c.

### BUILDING AND BUILDERS.

A MAUSOLEUM, to cost about 50,000*l.*, is being erected in Fairmount Cemetery, Newark, N.J., for Gottfried Krueger, a millionaire brewer of that city, which when completed will have few equals in point of architectural beauty in the United States.

A MEMORIAL-STONE of the new church of St. Stephen, Prenton, was laid on the 27th ult. Only the nave of the new church will be completed at present, and will cost about 4,000*l.*, seats being provided for 300 worshippers. The entire scheme will cost about 8,000*l.*

THE old building known as the Empire Music Hall and Vaults at Wolverhampton is to be rebuilt at a cost of about 42,000*l.* There will be nine entrances and exits, and the building will be lighted throughout by electricity. The license has been unanimously granted on the application of the architects, Messrs. Owen & Ward, of Birmingham, and the plans passed.

THE carpenters employed in the erection of the jubilee stand in the churchyard at St. Clement Danes, Strand, struck work for an advance in wages of 2*d.* per hour, from 10*d.* to 1*s.*, on Monday last. The men, numbering over 100, were employed by the firm of Messrs. Kirk & Randall, contractors, Woolwich, and, without the slightest warning, threw down their tools and refused to resume work until their demand had been conceded. Delegates were appointed to meet the employers, and it was pointed out on behalf of the men that the carpenters employed in the erection of stands at St. Paul's, Charing Cross, St. Martin's-in-the-Fields and other places had been conceded the 1*s.* per hour. Later in the afternoon the firm decided to grant the demand for an advance of 2*d.* per hour.

MESSRS. WARING & SONS, of 181 Oxford Street, have on exhibition a fine collection of the English productions of the Della Robbia Pottery from Birkenhead, and a very notable selection of embroideries from Spain and Italy. The exhibition was visited by Princess Christian, who evinced great interest in and an artist's appreciation of the various objects shown.

## VARIETIES.

THE small town of Namsos, in the province of Nordre Trondhjem, has been entirely burned. The flames spread with such rapidity, owing to the high wind, that the inhabitants, who number about 1,800, were unable to save even their furniture.

A FIRE broke out on Sunday last in the roof of Coatbridge East Free Church, Airdrie, while a large congregation was engaged in worship. A timely warning was given by the officiating clergyman, and the people quietly dispersed without the least confusion. The fire soon spread, and did damage to the estimated amount of 1,500*l*.

A HOUSE was struck by lightning at Blackburn on the 28th ult. Every pane of glass was shattered, and doors were torn off, furniture smashed and walls split. Two women and a child were injured.

THE public health committee of Aberdeen Town Council have reported the arrangements that had been made for the Congress of Sanitary Inspectors, to be held in the city on June 17.

A NEW school at Lostock, Grantham, near Northwich, to accommodate 300 infants, was opened on Monday last. It is a pretty half-timbered building, and has been built at a cost, exclusive of the site, of 1,200*l*.

THE Llandudno branch of the Metropolitan Bank of England and Wales has been reopened after extensive alterations, which have practically converted the old premises into a new building, with every modern improvement. The work has been done from designs by Mr. G. A. Humphreys, architect, the contractor being Mr. Thomas Jones.

IT is announced that the firm of Aldam Heaton, lately constituted as a limited company, is to extend the business, so long carried on in Bloomsbury Street, by opening new premises as showrooms for exhibition of designs and decorative furnishing work. This branch establishment will be opened on or about June 10 next, at 89 Mount Street, Grosvenor Square.

A CONFERENCE of delegates of trades favourable to the formation of a Scottish National Trades' Federation was held on the 29th ult. in the Trades Hall, Glasgow. Draft rules were submitted and approved. It is provided in the constitution of the Federation that "when any trade movement is likely to involve a society in a dispute with their employers, the society

shall give immediate notice to the secretary of the Federation, and should a strike or lock-out occur, no member or members of the Federation shall do any of the work of the men in dispute, or work on any job where 'blacklegs' are brought in to do the work of the men on strike or locked out."

THE next ordinary meeting of the Society of Engineers will be held at the Royal United Service Institution, Whitehall, on Monday, June 14, when a paper will be read on "The Compression of Air by the direct action of Water," by Professor Herbert W. Umney, Assoc.M.Inst.C.E., and a visit will be made to the London section of the Manchester, Sheffield and Lincolnshire Railway (extension to London) works in progress on Thursday, June 17.

THE new Gordon Hotel, which is being erected on the Lees at Folkestone, where it stands in its own grounds of about four acres, is rapidly approaching completion, and will be ready for opening in the course of a week or two. It contains accommodation for 350 visitors, and comprises excellent dining-halls and drawing-rooms, a library and many fine suites of private apartments. The grounds contain a number of tennis-courts, well sheltered, and it is intended to hold concerts in the large hall, whilst a private orchestra will perform during lunch and dinner in the public rooms.

THE promoters of the Whitechapel and Bow Railway scheme have concluded settlements with all the opponents who threatened opposition to this railway before the select committee of the House of Commons to which it was referred. The Bill, which will now pass as an unopposed measure through the first House, provides for the incorporation of a new company for the purpose of constructing a railway from junctions with the Metropolitan and Metropolitan District Railways at Whitechapel to a junction with the London, Tilbury and Southend Railway in the parish of St. Leonard, Bromley. The estimated cost of constructing this railway is 672,500*l*.

THE new Wesleyan school chapel, which adjoins the old sanctuary in the Dudley Port Road, Dudley Port, was formally opened on May 31. The building, which is of Gothic style, is capable of accommodating 400 persons, and is designed to harmonise with a larger chapel it is intended to erect on the remainder of the site when sufficient funds can be raised. Until the erection of the larger building the old chapel will be utilised as a school, and the structure, to which is attached an infant schoolroom, will be devoted to chapel purposes. The cost of building and furnishing is about 1,300*l*. The work has been carried

SOHO COWL  
AND  
VENTILATOR

(NICKLIN & MILWARD'S PATENT).

This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a House Cowl, possessing as it does great suctional power, perfectly noiseless action, and great durability, being made of steel.

The COWL has proved a perfect cure in the case of most troublesome chimneys.

## TESTIMONIALS.

"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to anyone suffering from smoky chimneys."

"Forward the 10-inch cowl on order at once; we have fixed the others, and find they give every satisfaction."

"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once."

Near BIRMINGHAM.

out by Mr. E. Cooper (Blackheath), under the direction of the architect, Mr. Alfred Long (West Bromwich).

THE Queen's rooms at the Windsor terminus of the Great Western Railway will be completed before Her Majesty's return from Scotland. They are contained within a building of handsome elevation, its Bath-stone walls being ornamented near the yard and platform entrances with Robin Hood stone tablets sculptured with an Imperial Crown and the motto "Dieu et mon droit," surrounded by acorns, oak sprays and laurel leaves. The interior of the royal station is divided into three chambers, the principal being the salon where the Queen will alight when arriving at or leaving Windsor. This is an elegant apartment, with niched walls and oak panelled wainscoting, the Italian Renaissance ceiling being domed by a cupola of tastefully leaded windows. An ante-room and lavatory adjoin it. The royal waiting-rooms and their approach are covered by an arched iron and glass roof springing from massive columns. This spans the broad road in front of the Queen's apartments, and affords a sheltered space for the assembling of cavalry escorts and guards of honour at State receptions. An ornamental verandah overhangs the platform side of the building and screens it from the weather. The electric cable, which is to convey the current for lighting the royal rooms, has been laid into the station.

A NEW United Presbyterian church in Langside, N.B., was opened on May 21. The new church stands on the site of the old one, at the corner of Langside Road and Stevenson Drive, the principal front being to Langside Road. It is in late Decorated Gothic style, and is built of yellow stone with red freestone dressings and corners. The main entrance is by a projected porch at the base of a tower which is placed at the north-east corner. The entrance has a richly moulded archway with a tympanum filled with cusped panelling, under which are double doors admitting to the vestibule. In the lower part of the main gable fronting Langside Road are two triplet windows lighting the area under the gallery, and above there is a large five-light window with moulded jambs and rich traceried head. On the side elevation the lower stage has a series of square-headed windows, and the upper stage has in each bay a three-light window with elliptic head. The pulpit-platform and organ-chamber form a projection of chancel form to the southern end. Above this is a four-light traceried window. The church internally is divided into nave and side aisles, with galleries at sides and end. The side galleries and main roof are supported on moulded-iron columns which rise the full height from the floor.

The roof is entirely in timber, with dressed main couples, partly filled in with moulded tracery. The session-house and vestry buildings form an attached group at the end of the Stevenson Drive front, and the hall buildings are at the south-west corner of the site. The church has been seated to accommodate 780 worshippers, the hall 300, and two classrooms forty each. The buildings have been designed by Mr. John B. Wilson, Glasgow.

AMONG the improvements which Lord Tweedmouth contemplates making at Hutton Castle are two new approaches, the one from the west by way of Berwick or Chirnside, across the Whitadder at the Blue Stone Ford, and the other from the east of the castle by way of Berwick, or through the Whitadder by Edington Mill Ford. A handsome lodge has been constructed at the west drive. Additional bedroom accommodation and buildings for servants, &c., are to be provided, so as to make a residence during certain seasons of the year in Berwickshire. Further stabling accommodation will also be erected. The old tower is to be made habitable, the centre part being raised one storey with four pepper-box turrets at the corners. The new portions will have asphalt roofs with embrasures and parapets. There will also be internal alterations. The architect is Mr. George Duns, of Duns.

THE new railway station at Boscombe, Bournemouth, was opened for traffic on the 1st inst. This station is the fifth built by the South-Western Company in the town within a radius of three miles from the pier, and for a population of 50,000.

CROYDON Corporation is about to apply to the Local Government Board for sanction to borrow 32,000*l.* for the construction of new waterworks at Waddon, where boring operations have been carried on with great success. The average daily consumption of water in Croydon is nearly 3,000,000 gallons.

#### ASBESTOS FIREPROOF DECORATIONS.

AN interesting exhibition of the products of the United Asbestos Company, Limited, as applied to the purposes of internal house decoration, was opened by Colonel Robert W. Edis at St. James's Hall on Monday last. The show, which is effectively arranged in the rooms of the Society of Architects, comprises specimens of all the company's specialties in "Salamander decorations," which are made wholly from asbestos, and are consequently entirely fireproof. Among the most

interesting of the exhibits may be mentioned specimens of crude asbestos, as taken from the mines in Italy; serpentine rock, showing the asbestos formation; asbestos in a state of partial manufacture (corded fibre), asbestos thread, yarn, cloth, &c.; asbestos-metallic cloth, as made specially for theatre curtains; working model of fire-resisting drop-curtain for theatres (Booth & Fisher's patent); illustration of Queen's Theatre, Manchester, after the fire in 1890. (The stage and effects were saved by the asbestos curtain); a piece of the asbestos curtain removed after the fire; asbestos curtains, plain and in colours; "besolite," fire and weather-proof, in lieu of wood, &c., for partitions, match-lining, roofs, bungalows, and portable buildings; rough model of portable building made with "besolite;" asbestos ropes and ladders for fire-escapes; asbestos jackets, gloves, &c.; asbestos blankets for isolating fires; asbestos fire and water proof cloth, suitable for awning, tents, &c., obviating danger from naked lights or sparks; asbestos paints, &c.; ordinary muslin treated with "anti-flame," which prevents ignition and does not destroy colours, and other specialties.

### NEW CATALOGUES.

MESSRS. GREEN & CO., of Bradford Street, Birmingham, who have acquired all Green & Comforth's patents, and those of John Green & Co. (both of which firms were of Wolverhampton), send a catalogue containing illustrations of their English hand-made locks and latches and rose attachment to knobs, combined patent double-hand mortise and V bolt locks and latches, patent combined two-bolt mortise and rim locks and latches, patent wedge catch and tell unpickable locks for safes and all purposes, patent tell-tale office door indicator locks, patent asylum and prison door locks, patent three-keyed treble secure locks suitable for hall and other outside doors where extra security is required, &c.

MESSRS. ADAMS & CO., of York and Leeds, are issuing a very elaborately got up catalogue consisting of upwards of one hundred folio pages of well-printed and profusely illustrated descriptions of their well-known sanitary specialties. To mention these categorically would require much more space than we have at our disposal. We cannot, however, pass over without special comment their patent "Epic" slab closet, which is unsurpassed for elegance of design by any which we have seen. Their "Cresset" urinal is also worthy of note, and architects and municipal authorities should obtain the book.

MESSRS. A. R. DEAN, LIMITED, of Corporation Street, Birmingham, have sent us their book of original designs for chimneypieces, grates, &c. Among the illustrations are some excellent reproductions of photographs of a hall, dining, drawing, billiard and bedrooms, completely furnished and showing in *ensemble* the fittings which are elsewhere given in detail. As the latter are also from photographs, and are plainly priced, the book will be found most useful to those in search of such goods.

### MANCHESTER COUNCIL FOR THE REGISTRATION OF PLUMBERS.

THE last lecture of the series for 1896-97, arranged by the Manchester Council for the Registration of Plumbers, was delivered on Monday last at the Municipal Technical School by Mr. H. Gilbert Whyatt, deputy borough engineer, Salford, who took for his subject "The Requirements of Municipal Authorities with respect to Plumbing." Mr. J. H. Edmiston, vice-president of the Council, presided.

Mr. Whyatt traced the progress of sanitary legislation down to the Public Health Act, 1875, and the Public Health Acts Amendment Act, 1890, in which plumbers had special concern. He then took the plumbers' work in a house *seriatim*, and explained the requirements of Acts of Parliament and local by-laws, particularly those of Manchester and Salford, with regard to eaves, gutters, down-spouts, water-closets, cisterns, traps, soil-pipes, vent-pipes, waste-pipes, water-fittings, hot-water supply, gasfittings, &c., and incidentally he discussed such matters as the allowance of water made for flushing purposes, the quality of material fittings, &c. In conclusion, the lecturer said that, seeing municipal authorities had such stringent regulations and powers, they should be very careful with regard to those whom they placed on their "authorised lists" of plumbers. He agreed in the contention of the Association that nobody should be certified by a municipal authority as a qualified plumber (for that was how the public regarded it) without passing an examination such as was required from candidates for registration. Every plumber and journeyman in the district should be registered, as a guarantee to the public of his fitness to carry out the very responsible work entrusted to him, and the authorities might with advantage require anyone applying to be placed on the authorised

list of plumbers that he should present the Association's certificate of qualification. On the other hand, he would require the Corporation inspectors to pass a searching examination in plumbing, for it was palpably unfair that a craftsman who had spent years in learning a trade should be at the mercy of an inspector who might have no knowledge of the trade at all.

### WATER DIVINING.

At the annual audit of the accounts of the Urban District Council of Ampthill, Bedfordshire, which was completed on Friday last by Mr. W. A. Casson, the Local Government auditor for the county, several ratepayers raised objections to an expenditure incurred in the employment of Mr. Leicester Gataker, a water diviner. They produced geological plans and sections to show that, if the diviner's recommendations were acted on, the Council would be boring into a stratum of Oxford clay, the depth of which had not been fathomed as yet, although a boring had been made to 700 feet and no water obtained. The district council had applied to the Local Government Board for a loan to carry out boring experiments to test Mr. Gataker's recommendations. The Board ordered a water supply to be procured within a limited time, leaving the council a free hand how they went to work, and they unanimously resolved to employ Mr. Gataker. In reply to the auditor, the chairman said that Mr. Gataker did undoubtedly hold out that he had a mysterious power of discovering water. His method was to start with his arms spread out and walk slowly over the ground. Suddenly he would stop as though he felt a shock, and it was there that he "located" a spring. He would then step backwards and forwards to ascertain the depth of the spring and the volume of water. In his report he named a number of springs in one field, and the total of the water there was more than ample for the town. The auditor, in announcing his decision, stated that in seeking for water the district council had disregarded the reports of experts and had gone for guidance to a man who had a reputation for discovering water by some unusual and peculiar method not possible to ordinary persons, and the question he had to settle was whether this was legal or not. He noted that Mr. Gataker took the trouble to do what ordinary professional men would not think of doing, namely, to state, "I guarantee my business to be genuine," whilst no guarantee whatever in the legal sense was given that water would be found where it was located. Money

might properly be spent on experimental borings under proper advice, but it had not been proved that this man had any greater power than anyone else. The district council were in the position of trustees of public moneys and must not spend them in a speculative manner. In the only case that had come before the courts which bore upon this matter the judges had held that "the pretence of power, whether moral, physical, or supernatural, with intent to obtain money was sufficient to constitute an offence within the meaning of the law," and he (the auditor) thought that, as Mr. Gataker claimed to exercise some such power, his employment was clearly illegal, and the amount of his fee would therefore be disallowed, and the gentlemen who authorised the payment surcharged with it. They could appeal either to the Queen's Bench Division or to the Local Government Board against the surcharge.

### COUNTY COUNCIL FINANCE.

THE report of the district auditor, Mr. Lloyd Roberts, on the accounts for the year ended March 31, 1896, has been presented. The gross indebtedness of the Council on that date, with respect to loans on mortgage and Metropolitan Consolidated stock amounted to 34,937,730 $\frac{1}{2}$ l., but, taking into consideration the Council's assets, consisting principally of outstanding loans to local authorities and the value of the surplus lands held by the Council, the net debt on the date mentioned was 19,215,400 $\frac{1}{2}$ l. In the course of a few observations on the accounts of the Works Department, the auditor points out that the department was not entrusted with the expenditure of cash, except in small amounts for petty disbursements, and the accounts kept by the officers of the department related simply to the apportionment of the cost of labour and materials to the various works which they executed. It was to be remarked that the irregularities were detected without delay by the comptroller under the system of check provided. The system of accounts adopted was one which, in his opinion, if properly carried out, enabled the Works Department to show the cost of the various works executed by them, as far as it was possible to arrive at the same. But he observed from the comptroller's report to the special committee dated December 11, 1896, that "documents were in some cases fabricated and in others tampered with, that there was collusion between various officials of the department, and it was only by questioning and testing original vouched documents that the improper entries were dis-

covered." When those conditions existed, his experience led him to the conclusion that it was only from information or knowledge outside of the documents that irregularities of this kind could be detected.

### THE BLACKWALL TUNNEL.

ON Saturday, May 22, the Blackwall Tunnel, "the first great achievement of the London County Council," was opened by the Prince and Princess of Wales on behalf of the Queen. The necessity of additional means of communication between the north and south banks of the Thames below London Bridge has been felt for many years. It was a pressing need even in the beginning of the century, and it has become accentuated as the manufacturing districts have extended eastward along the river. Up to the present time, however, the population of the East End, numbering 1,700,000, or a larger number than the combined populations of Liverpool, Manchester, Salford and Birmingham, have not possessed a free river crossing between the Tower Bridge and the Woolwich Free Ferry, a distance of nearly nine miles. During the past ninety years many proposals have been made for crossing the Thames below London Bridge. The first work of the kind, attempted but not completed, was Vases's Tunnel at Limehouse in 1805. Then came Brunel's Tunnel in 1825 to 1841, between Wapping and Rotherhithe, which, originally intended for road traffic, is now used by the East London Railway. The Tower Subway, constructed by Messrs. Barlow & Greathead for foot-passengers, followed in 1869-70; and, finally, the Metropolitan Board of Works obtained an Act in 1887 to make a tunnel at Blackwall, six miles from London Bridge. The design, as proposed by Sir Joseph Bazalgette, consisted of three tunnels, two for vehicular traffic and one for foot-passengers, and it was determined to construct that for foot passengers in the first instance. Messrs. S. Pearson & Son obtained the contract for the work, but the Metropolitan Board of Works being superseded by the London County Council, and the latter body considering that a larger tunnel ought to be made at once, the contract was never carried out. It was then three years before the final decision was arrived at by the County Council, and at the end of 1891 the contract for the present tunnel, designed by Mr. Alex. R. Binnie, M.Inst.S.C.E., chief engineer to the Council, was obtained by Messrs. Pearson & Son, the amount of their tender

being 871,000*l*. The tunnel crosses the river  $1\frac{1}{2}$  mile below Greenwich and 3 miles above Woolwich, and will bring these growing and populous places into direct communication with Poplar and the East and West India Docks on the north side of the Thames. At this point the river is 1,200 feet in width and 46 feet in depth at high water. Some engineering authorities regarded the success of the undertaking as doubtful, for, while large tunnels had been driven under rivers through rock, it was pointed out that there would be very considerable difficulty in getting through the large, deep bed of coarse gravel with but little sand that would be encountered under the Thames. Mr. Binnie, however, held to his view, and the complete success of the tunnel has justified him.

The total length of the work is 6,200 feet, or nearly  $1\frac{1}{4}$  mile, being about the same distance as from Charing Cross to St. Paul's. On the south of the river on the Kent side, the incline is on a gradient of 1 in 36, and has a run of 2,408*ft* 6; the portion under the river for a distance of 1,212 feet is level; and the north, or Middlesex, incline has a gradient of 1 in 34 for a length of 2,579*ft* 6. In other words, the inclined approaches will not be so steep as parts of St. James's Street and Regent Street, and very much less so than the slope on the east side of Trafalgar Square; they will, however, be about equal in gradient to the Haymarket. The work is divided into three portions—open approaches with side walls; "cut-and-cover" arched over with brickwork; and the tunnel proper composed of cast-iron rings lined with concrete and faced with white glazed tiles, all the other parts of the work being faced with white glazed bricks. To facilitate the work so as to permit of altering its direction, which it would be difficult to do by means of a long curve in a tunnel of this description lined with cast-iron, and to secure ventilation there are four shafts varying in depth from 75 feet to 98 feet and having an internal diameter of 48 feet. The tunnel proper is circular in cross-section, 27 feet outside diameter (or 6 feet larger than that of St. Clair, the largest hitherto constructed), built up of fourteen cast-iron segments and a key-piece, each complete ring of segments being 2 feet 6 inches in width. The thickness of the cast-iron is 2 inches, the flanges are 12 inches in depth, and each segment weighs about one ton. The effective diameter of the tunnel is 24 feet 3 inches. Within this the road of 16 feet, with two footpaths each 3 feet  $1\frac{1}{2}$  inch in width, is formed, resting on an arched subway 12 feet in width and 5 feet 6 inches in height for the reception of water-pipes. This road will be of the same width as parts of Little Queen Street,

## THE "SUNLIGHT" INCANDESCENT GAS BURNER.

PRICE FROM 5/3 COMPLETE.

Combines High Illuminating Power and Great Economy of Gas with a Soft Pleasant Light.

THE NEAREST APPROACH TO SUNLIGHT. THE IDEAL LIGHT FOR DOMESTIC USE.

*The Mantles are the strongest in the Trade.*

"COSMO" BURNER Complete, as shown, 12-inch shade, 7/9 each.

Price List and Terms on Application.

THE NEW INCANDESCENT (Sunlight Patent) GAS LIGHTING COMPANY, LIMITED,  
33 & 34 SHOE LANE, LONDON, E.C.

Holborn, and King Street, Westminster, and of a greater width than parts of Drury Lane, Fetter Lane, London Wall and Lombard Street, and as there will be no occasion for stopping at shops, houses and street corners, it should be ample for two lines of the largest vehicles. Should the traffic, however, increase beyond the capacity of the tunnel, land has been secured for the construction of another and parallel line of tunnel. The road is paved with asphalt in the level portion under the river and with granite laid in tar and pitch on the inclined approaches.

Although the most difficult portion of the work was that under the river itself, still almost as many difficulties were encountered inland on either side, as the ground was saturated with water in direct communication with the river. For some distance in mid-river the tunnel was driven within 5 feet of the river bed, and the intervening ground consisted of coarse gravel. The mode of driving the tunnel was by means of a shield which was worked under compressed air. This shield was a structure of steel, weighing about 250 tons, cylindrical in shape, 19 feet 6 inches in length and 27 feet 8 inches outside diameter. It was stiffened by two circular portions 3 feet apart, and its forward or working face, which pressed against the material to be excavated, was divided into twelve pockets or cells by three horizontal and three vertical portions. It was within these spaces, which were 6 feet in height, that the men worked. Between the two circular stiffening partitions were formed air-locks and shoots for passing out the excavated material. Arranged round the inner circumference of the shield and attached to it and the circular partitions were disposed twenty-eight hydraulic rams for the purpose of pushing the shield forward. The enormous water pressure of  $2\frac{3}{4}$  tons to the square inch was used in thrusting the shield forward, and sometimes the total pressure was as much as 5,000 tons. In the rear of the shield, or that portion of it which faced the completed tunnel, was a space which was merely enclosed within the outer skin of the shield. This, which is called the "tail" of the shield, always overlapped by 2 feet 6 inches, or one cast-iron ring, the last completed portion of the tunnel, and within it were built up the various rings of iron with which the tunnel is lined. The face of the shield was kept open when working in clay, but when in gravel it was almost completely closed by iron shutters. These shutters were opened by a very small amount at one time, and for several weeks near the centre of the river all the excavation was done through small holes 7 inches by 3 inches.

In all tunnels where water is encountered in large quantities compressed air is now generally adopted. The air is compressed by engines on the surface to the pressure of the water met with in the workings, and is then taken by pipes to the tunnel. The air drives the water out and keeps the ground to be excavated comparatively dry. To prevent the air from escaping along the already completed portion of the tunnel a brick bulkhead is built across the tunnel at some distance behind the working face, forming what is practically a horizontal diving bell, the space between the bulkhead and the working face being filled with compressed air. Entrance to and exit from this space is obtained by means of locks in the bulkhead. At the Blackwall Tunnel an air-pressure of about 27 lbs. to the square inch beyond the ordinary atmospheric pressure was necessary, and engines of about 1,200 horse-power were required to compress the amount of air used. To insure the safety of the men and to prevent the compressed air from blowing up the ground above the shield, a layer of clay about 10 feet thick and 150 feet wide was deposited from barges over the line of the tunnel. Absolute safety was not, however, attained by this method, as twice holes were blown in the bed of the river and the water poured into the tunnel, but on each occasion the men happily escaped without accident. A large portion of the clay placed on the river bed was afterwards excavated in the tunnel. As working in compressed air is very dangerous for some persons, great care was exercised in selecting the men, and every man was medically examined before he was allowed to start work. The County Council furthermore obtained powers to compensate workmen injured while working under compressed air, and in cases of death to make allowances to widows and orphans. Owing to the precautions taken, however, compensation for injury has only been necessary in half a dozen cases, and there have been no deaths directly due to the effect of compressed air.

In the design of the houses at each entrance, the Council's architect, Mr. T. Blashill, was associated with the engineer. The houses have an ornamental appearance, and will form residences for the superintendent of the tunnel and the caretaker, besides which the archway under each house will serve the purpose of measuring the height of loaded waggons before entering the tunnel. Much attention has been devoted to the lighting of the tunnel. As already stated, the interior is lined with a white glazed face, and an electric installation has been arranged to supply current for lighting. The test fixed was that the light should be "sufficient to read the *Times* newspaper in

M. KUSEL, Sole Belgian Representative of "The Architect & Contract Reporter,"

45 MONTAGNE-AUX-HERBES-POTAGERES, BRUSSELS.

any part of the tunnel." This work has been carried out by Messrs. Laing, Wharton & Down, Limited, according to plans and specifications prepared by Mr. T. P. Gunyon, the chief electrical engineer of the County Council. The lighting is by means of about 700 lamps of 32-candle power, mostly suspended in water-tight fittings from the roof of the tunnel, both over the road and over the pathways. The open approaches and stairways are lighted by lamps in handsome lanterns, and the entrance-gates, the shafts and the wharf and engine-house by arc lamps of the long-burning type. No gas is admitted to any portion of the tunnel.

The following figures, in addition to those already given, will be found interesting:—The number of men employed at one time on the works was 800. In the construction of the tunnel there were used 17,000 tons of cast-iron, 7,000,000 bricks, 1,000,000 white glazed tiles, 20,000 tons of cement, 110,000 tons of concrete, five acres of asphalt and twelve miles of electric-light cables. The quantity of earth excavated is set down at 500,000 tons. The total time occupied in the construction of the tunnel has been a little over five years, the contractors having begun operations in 1892; but at least a year of the time was occupied in preparatory work, such as the diversion of sewers. The portion of the tunnel under the Thames was constructed in almost exactly twelve months, which is at an average rate of 100 feet per month.

The cost of such a work as this is, of course, of great interest, but the risks incident to tunnelling in gravel within a few feet of the bed of a navigable river must generally render the contract cost of such undertakings of uncertain value. As already stated, the cost of the completed work as contracted for by Messrs. S. Pearson & Son was 871,000*l.* The County Council are entitled to take some credit for the fact that the actual cost has been below this amount, and that it is "well within the estimate of their engineer," a matter which the rate-payers, who have not recently had much cause to admire certain classes of work done by the Council, will regard with gratification. It is satisfactory to know that the accidents, which are inseparable from every large engineering work, have been few and far between at Blackwall. Undoubtedly the success of this great undertaking is due in the first place to the Council's engineer-in-chief, Mr. Binnie, who designed it and who has carried it out so satisfactorily. Mr. Binnie has won the admiration of all eminent engineers, and speaking last month upon the subject Sir Benjamin Baker referred to the boldness of conception and the

perseverance and ability with which the work has been carried out. All intermediate works, he said, were really insignificant in comparison. He had visited all the subaqueous tunnels of importance except the Thames Tunnel; the Hudson tunnel and others he had been intimately associated with as consulting engineer, and he had also visited Sarnia; and his opinion, expressed without reservation, was that there was nothing in the world that could be compared with the work that had been accomplished at Blackwall. Credit was due, he added, to the engineers and contractors for having undertaken an absolutely original work without guidance from anybody. Mr. Binnie himself fully acknowledges the skill and untiring energy of Mr. David Hay, M.Inst.C.E., and Mr. Maurice Fitzmaurice, M.Inst.C.E., the two resident engineers, and Mr. E. W. Moir, M.Inst.C.E., the contractors' engineer, to whom in a great measure the success achieved is due. In contemplating the result of the labours of these engineers, it is interesting to note the progress that has been made in this class of work during the past fifty years. Brunel's tunnel was about the same length as the portion under the river at Blackwall, and it took about nine years, with many long pauses, to complete; the portion of the Blackwall tunnel under the river between shafts 2 and 3 was tunnelled in about thirteen months. The cost of Brunel's tunnel was at the rate of about 1,300*l.* per yard, while that of the Blackwall averages 550*l.* per yard. At the same time, it must not be forgotten that engineers of the present day are largely indebted for the means which have enabled them to make progress to such men as Brunel, Bramah and Dundonald.

### NEW SANITARY OFFICES FOR GLASGOW.

AN important addition to Glasgow's public buildings has been erected to serve the purpose of Sanitary Chambers in place of the old and totally inadequate premises which were acquired some twenty-five years ago. The site of the new building is at the junction of Cochrane Street and Montrose Street, within 200 yards of the Municipal Buildings. Externally the block is handsome and imposing. Built of Overwood stone, the new building is three storeys in height, with a square tower 70 feet high at the corner where the two streets join. The front elevations have been freely and ornately treated in the style of the later Renaissance. The first storey, which is bold in archi-

ecture, with rusticated courses and round-headed windows, forms a substantial base for the lighter and broader treatment of the second and third flats. Above the main entrance in Montrose Street is a statue of Hygeia, and over the main cornice the skyline is broken by a rich balustrade, interrupted at intervals by pediments and finials. The whole design has the stability and stateliness becoming a public building. In addition to the three storeys there is a basement floor, which is devoted to storage purposes and accommodation for drain-testing and lime-washing apparatus and operators. Practically the whole of the ground floor is occupied by Mr. Peter Fyfe, F.R.S.E., the sanitary inspector, his assistants, inspectors, draughtsmen, &c., who number in all about 180. The only exceptions are the south-west corner, which is devoted to the vaccination department, and comprises rooms for the officer (Dr. Carmichael) and waiting and operating-rooms, and the north-east corner, where there is a room where suspected patients may be isolated until examined. On the first floor Dr. Russell, the medical officer of health, and Dr. Chalmers, the junior officer, have their rooms, and accommodation is also provided for the veterinary surgeon and the other medical assistants. The rest of the storey, and also the greater part of the second floor, is occupied by the inspecting sanitary officers. Those for each district of the city have a room set apart for their use. A caretaker's house is also provided, and the large square tower which surmounts the building is used as a chemical laboratory. The principal novelty in connection with the chambers is the proposed bacteriological department, the institution of which is believed to be a unique departure in municipal enterprise in this country. Also on the second floor is an exhibition-room, where it is proposed to show and test all forms of sanitary appliances which may be submitted to the sanitary inspector for his opinion. The chambers are fitted and furnished in the most comfortable and convenient style. Special attention has been paid to lighting, heating and ventilation. The artificial illuminant is electricity from the Corporation mains. The buildings are heated by steam at a pressure of 25 lbs. per square inch, utilised in pipes, coils and radiators. The vitiated air, extracted by three Blackman's fans, finds exit by means of ducts in the ceilings of the corridors to outlets on the roof. In the construction of the patients' rooms the corners have been rounded and projecting surfaces reduced to a minimum, in order to afford as little harbourage as possible for dust and germs. The lavatory accommodation includes baths—not a luxury, but a necessity, in view of the disagreeable character of

much of the sanitary inspector's work. In the court at the rear of the main building is an examination and refrigeratory house for investigations in connection with diseased meat.

The plans of the new chambers were prepared in the City Engineer's office under the supervision of Mr. A. B. M'Donald. The principal contractors were:—Masons, Messrs. Alexander Thomson & Son, Glasgow; joiners, Messrs. William M'Call & Son, Glasgow; plumber, Mr. Matthew Sproul; and plasterers, Messrs. D. & J. Mackenzie. The site for the chambers cost 11,000*l.*, and the buildings about 19,000*l.* Although the chambers have not yet been formally opened the sanitary staff is already in occupation.

### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

#### APPLICATIONS FOR PATENTS.

- 12155. George B. Phillips, for "Reliable window-fastener."
- 12197. Edward Evan Bennett, for "Improvements in adjustable tables."
- 12221. Samuel Walker and John Poole, for "An improved expandible pulley."
- 12341. Edwin Waddington, for "A new method of brick-making."
- 12255. John Day Pastle, for "An apparatus for controlling the movements of doors."
- 12272. Henry Donald Hope, for "Improvements in fastenings for window casements."
- 12282. Edmund Fisher Hartshorn, for "Improvements in window shade and blind fixtures."
- 12303. Heinrich Spatz, for "Process and apparatus for the manufacture of metallic pipe-joints."
- 12307. Daniel L. M. Evans and James Jones, for "Improvements in window sash-fasteners."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

# THE NEW EXPANDED METAL

**Meshes from  $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to  $\frac{3}{16}$ th in. thickness of steel.**

**FOR BUILDING CONSTRUCTION**, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

**FOR SOLID PLASTER PARTITIONS**, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

**FOR FIREPROOF LATHING**, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

**FOR CONCRETE FLOORS WITH EXPANDED METAL**.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

**FOR EXTERIOR WALLS OF BUILDINGS**.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

**FOR FENCING, TREE GUARDS, WINDOW GUARDS**, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

**OTHER USES FOR EXPANDED METAL**.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

**BRASS, ALUMINIUM**, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

**CATALOGUES AND PRICE LISTS** can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

**THE EXPANDED METAL COMPANY, LTD.,**

**39 UPPER THAMES STREET, LONDON, E.C.**

Telegraphic Address, "Distend, London."

Works—WEST HARTLEPOOL.

Telephone No. 1829.

## EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

## NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

*For Advertisement Scale, see page xiii.*

## COMPETITIONS OPEN.

BOOTLE.—July 31.—Competitive plans are invited of a technical school to be erected at the corner of Balliol Road and Pembroke Road, at a cost not exceeding 15,000*l.* Premiums of 50, 30 and 20 guineas will be awarded for the designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. J. H. Farmer, town clerk, Town Hall, Bootle.

MORECAMBE.—Competitive designs are invited for the erection of a new hotel, to be called the Hôtel Métropole, at a cost of 30,000*l.*, at this picturesquely situated and rapidly increasing fashionable seaside resort. Designs must be sent in under motto on or before June 16, 1897.

## CONTRACTS OPEN.

ABERDEEN.—June 16.—For additions and alterations to the farm offices at Mains of Shiels. Mr. William Nicol, forester, Cluny.

ABERDEEN.—June 17.—For erection of eight houses. Mr. John Rust, city architect, 224 Union Street.

ASHREIGNEY.—June 15.—For taking-down and reconstructing in timber the defective part of Kersham Bridge, over the river Taw. Mr. H. Masterton, county surveyor, Boutport Street, Barnstaple.

ASHTON-UNDER-LYNE.—For erection of a pair of detached houses. Mr. Thomas D. Lindley, architect and surveyor, 150A Stamford Street, Ashton-under-Lyne.

ASKAM-IN-FURNESS.—June 15.—For building a new classroom at the Ireleth School. Rev. J. A. Roberts, Ireleth Vicarage, Askam-in-Furness.

AYLESBURY.—June 18.—For erection of schools and offices at Quainton. Mr. W. F. Taylor, architect, Aylesbury.

BALA.—June 26.—For erection of classrooms, laboratories and other works for the Bala County School for Boys. Mr. R. Lloyd Jones, architect, Mount Place, Bala.

BARKING.—June 17.—For erection of retort-house, boiler-house, exhaustor-house and mess-room. Mr. W. North, Gasworks, Stourbridge.

BARNSTAPLE.—June 16.—For alterations and additions at 87 High Street. Mr. W. C. Oliver, Bridge End, Barnstaple.

BARNSTAPLE.—For cleaning and colouring the inside walls of the parish church. Mr. W. Boyle, verger.

BELFAST.—June 15.—For papering, graining, &c., of board, committee and waiting rooms of the workhouse. Mr. James C. Neeson, clerk, Workhouse.

BIDEFORD.—June 29.—For repairs to 16 Bridgeland Street. Mr. R. T. Hookway, Bideford.

BRADFORD.—June 14.—For erection of a large block of shops and dwelling-houses and entrance archway in Manningham Lane. Messrs. Mawson & Hudson, architects, 2 Exchange Buildings, Bradford.

BRIDLINGTON.—June 26.—For construction of a brick gas-holder tank, 102 feet in diameter and 25 feet deep. Messrs. Thomas Newbigging & Son, engineers, 5 Norfolk Street, Manchester.

BRIGHTON.—June 15.—For alterations at Warren Farm Schools, Rottingdean. Mr. T. G. Gibbins, architect, Molesworth House, Palace Yard, Brighton.

BRIGHTON.—June 14.—For erection of a cookery school, and a school for afflicted children. Messrs. Thomas Simpson & Son, 16 Ship Street, Brighton.

CANTERBURY.—June 24.—For repair or renewal of the wood-paled fence enclosing the old moat in Rhodas Town. City Surveyor, 28 St. Margaret Street, Canterbury.

CARLISLE.—For erection of a villa residence in Dalston Road. Messrs. Johnstone Bros., architects, 39 Lowther Street, Carlisle.

CARLISLE.—June 21.—For erection of laboratories and lecture-rooms at the Grammar School. Mr. Geo. Dale Oliver, architect, 5 Lowther Street, Carlisle.

CANTERBURY.—June 18.—For erection of a chimney shaft, foundations, setting and fixing of a Cornish boiler, alterations to boiler-house, subway from boiler-house to new blocks, alterations to laundry and steward's stores and additional works of sewage disposal at Chartham Asylum, Chartham Downs. Mr. W. J. Jennings, architect, 4 St. Margaret's Street, Canterbury.

CHESHIRE.—June 16.—For erection of offices, board-room and committee-rooms on land adjoining the workhouse at Knutsford. Mr. Robert J. McBeath, architect, Birnam House, Sale, near Manchester.

CHOPWELL AND HIGH SPEN.—June 19.—For erection of three six-roomed houses at Chopwell and thirteen two-roomed cottages at High Spen (all brick buildings). The Secretary, Consett Iron Company, Limited, Blackhill, co. Durham.

COLNE.—June 23.—For construction of a chimney 70 yards high and flue, in connection with the refuse destructor at the proposed health dépôt. Mr. T. H. Hartley, borough surveyor, Town Hall, Colne.

CORNWALL.—June 18.—For erection of a first-class hotel at Mullion Cove. Mr. Sampson Hill, Redruth.

CORNWALL.—June 16.—For construction of orchestra, vestries, at the Wesleyan Chapel, St. Day. Mr. Sampson Hill, architect, Green Lane, Redruth.

CORNWALL.—June 19.—For erection of a dwelling-house for Trebarwith Farm, in the parish of Tintagel. Mr. Seth Lobb, of Messrs. Wise & Wise, architects, Launceston.

# THE "WATERWITCH" WATER WASTE PREVENTER.

PATENT.

*Passed by all the Leading Cities and Towns Waterworks.*

## ADVANTAGES.

- (1) No Valves to get out of order.
- (2) Easy to Pull.
- (3) Quick Delivery and Silent in Action.

Can be fitted in Iron Cisterns if desired.

Fittings supplied for Plumbers to fit to their own Cisterns if required.

# THE VALVELESS SYPHON CO., KIRKSTALL, LEEDS.

CORNWALL.—June 18.—For repairing and renovating the St. Stythians Board Schools. Mr. Horace W. Collins, architect, Penryn Street, Redruth.

CORSHAM.—June 28.—For additions and alterations at Mansion House. Mr. Thomas Holloway, Chippenham, Wilts.

CROYDON.—June 21.—For excavating about 355 cubic yards of earth and erecting about 1½ rods of brickwork in Croyham Road. Mr. E. Mawdesley, town clerk, Town Hall, Croydon.

CUMBERLAND.—June 14.—For erection of public offices and free library at Wilson Terrace, Frizington. Messrs. Moffatt & Bentley, architects, Whitehaven.

DENABY MAIN.—For erection of St. Alban's Church and Presbytery. Messrs. Empsall & Clarkson, architects, 7 Exchange, Bradford.

DERBY.—June 21.—For additions and alterations to the Orchard Street Board School. Mr. A. Macpherson, architect, Tenant Street, Derby.

DEVON.—June 15.—For building a farmhouse at Broadley, in the parish of Tamerton Foliot. Mr. Dennis, Farmhouse, Broadley.

DEWSBURY.—June 17.—For erection of two cottage homes in Heald's Road. Messrs. Holtom & Fox, architects, Westgate, Dewsbury.

DOVER.—June 29.—For erection of a carshed at Buckland. Mr. Henry E. Stilgoe, Town Hall, Dover.

DURHAM.—For repointing and repairing the mason and brick-work and painting and papering at the county police station. The County Surveyor, Shire Hall, Durham.

DURHAM.—June 12.—For the conversion of miners' hall, Leadgate, into council chambers, surveyor's office, clerk's office, &c. Mr. Geo. Thos. Wilson, architect, 121 Durham Road, Blackhill.

DURHAM.—June 12.—For erection of three houses, &c., in Aynsley Terrace, Consett. Mr. Geo. Thos. Wilson, architect, 121 Durham Road, Blackhill.

DURHAM.—For erection of four cottages at Blackfine. Mr. Phil. Stokoe, 71 Durham Road, Blackfine.

EDENBRIDGE.—June 14.—For pulling-down old houses and erecting new houses and ironmonger's shop. Mr. Beale, surveyor, Madeira Park, Tunbridge Wells.

EDINBURGH.—June 11.—For erection of a urinal (in stone and brick) at the east end of Promenade. The Burgh Engineer, 1 Parliament Square, Edinburgh.

EDINBURGH.—June 12.—For painter and joiner's work at internal fittings for various schools. Mr. Wilson, 3 Queen Street, Edinburgh.

ELGIN.—June 12.—For additions and alterations to property in Maida Place. Mr. James Jamieson, architect, 2 Commercial Street, Elgin.

ELGIN.—June 17.—For additions and alterations to dwelling-house at Woodlands, Bishopmill; additions and alterations to farm steading at Burnbank, Birnie. Seafield Estates Office, Rothies.

FENTON.—June 15.—For construction of a brick culvert, about 125 yards in length, with manholes, &c. Mr. S. A. Goodall, surveyor, Town Hall, Fenton.

# IMPORTANT TO ARCHITECTS

**WM. WALLACE & CO.** have special facilities for carrying out Architects'

Designs in the best manner at the lowest possible cost, and invite drawings and specifications for Estimates (free of charge).

**Specimens** of the **High-class Workmanship** and **Materials** supplied by **Wm. Wallace & Co.** may be inspected at the under-mentioned Clubs and Institutions:—

ROYAL COLONIAL INSTITUTE,  
CLAYBURY ASYLUM (L.C.C.),  
MERCHANT TAYLORS' SCHOOL,  
MIDDLESEX HOSPITAL (Convalescent Home),  
LONDON FEVER HOSPITAL (Nurses' Home),  
BANSTEAD ASYLUM (L.C.C.),  
ROYAL ASCOT GOLF CLUB,  
PIONEER CLUB,

TUNBRIDGE WELLS GOLF CLUB,  
DULWICH COLLEGE,  
HOXTON HOUSE ASYLUM,  
NATIONAL CLUB,  
ORIENTAL CLUB,  
LONDON EXHIBITIONS CO.,  
ST. GEORGE'S CLUB,  
CRIPPLEGATE INSTITUTE,

ROYAL BENEVOLENT MEDICAL COLLEGE (EPSOM),  
METROPOLITAN TOWER CONSTRUCTION CO.

## OUR FLAT.

Visitors to the  
Victorian Exhibitions  
at the  
Crystal Palace  
and Earl's Court  
should make a  
point of inspecting  
the  
**ARTISTIC  
SUITE of ROOMS**  
entirely furnished  
and decorated by  
**WALLACE,**  
OF  
CURTAIN ROAD, E.C.

# Wm. Wallace & Co.

For erection of stables, coach-house and other buildings, in connection with Boyle Hall. Messrs. C. S. NELSON & R. W. SAVAGE, architects, Sun Buildings, 15 Park Row, Leeds.

W. KITSON & SON, Wakefield (*accepted*) . £1,600 0 0

## ELECTRIC NOTES.

A STATEMENT has just been prepared by Councillor Mackenzie, convener of the electric-light committee, of the income and cost of the electric lighting of Edinburgh from May 15, 1896, to May 15, 1897. The income from private lighting, at 5d. per unit, and from motor power was :—Summer term, 3,080d.; winter term, 8,418d.; spring term, 9,184d.;

together, 20,682d., as against an estimated income of 16,500d. The income from arc lighting was 6,283d., as against an estimated income of 7,250d., the difference being caused by the late delivery of the arc lamps for the city extensions. The total income was therefore 26,965d., as against an estimate of 23,750d., or an excess over estimate of 3,215d. The cost of manufacture, distribution, &c., was 19,200d., which showed a profit of 7,765d. The output was 1,102,700 units sold for private lighting and motor power, and 621,260 for arc lighting—a total of 1,723,960 units. The cost has now been reduced to 4d. per unit, or, with the discount off, practically 3½d. per unit. The cost per arc lamp for public lighting is now 16d. These rates are the lowest charged for electric lighting in the United Kingdom.

A LOCAL GOVERNMENT BOARD inquiry was recently held at Handsworth to consider the question of lighting the public buildings by electricity, and the application of the District Council for permission to borrow 2,200d. for that purpose. There were present Councillors W. A. Ellis (chairman of the Council), D. Rose, J. J. Hughes, H. Loveridge, F. Lempriere, and S. Adkins, and Mr. H. Ward (clerk). Mr. Ward, in reply to the inspector, gave the population of the district as 41,600, and the annual assessable value as 161,233d. The balance of outstanding loans under the Sanitary Acts and the Public Health Acts of 1875 was 84,762d., and the loans which had been sanctioned but had not been taken up, 23,990d., giving a total of 108,752d. He also pointed out that though the amount of loans taken up was only 85,000d., they were entitled to borrow 213,714d., and that the Council owned property to the value of 41,607d. The loan of 2,200d. which was now being applied for was for the purpose of providing electric light for the council house, library, lecture-halls, stabling, fire station and the new technical schools. That light would render the council house much more comfortable to those who attended there, particularly those who frequented the library. At the present time the heat from the gas in winter was almost unbearable, and there was also a considerable loss arising from the injury done to the books by the gas fumes. The new form of light would also be much better for the work of the technical school than gas would. Evidence as to the details of the buildings and plant was then given by Mr. Henman, the architect, and Mr. Vaudrey, M.Inst.C.E. The engineer and inspector then visited the premises proposed to be lighted.

THE report of the gas committee of the Salford Borough Council for the year ended March 25 last, which was approved, stated that there had been an increase in the business of the

# EWART'S COPPER "CROWN" VENTILATOR

FACTORY—346, 348, 350 EUSTON RD.,  
LONDON, N.W.

department during the year, the output of gas being nearly  $4\frac{1}{2}$  per cent. more than in the previous year, and the receipts for residuals had been better. The cost of coal had been slightly more, but the illuminating power of the gas had been better. The working expenses had been less and the total result of the year's operations was very satisfactory. The quantity of coal and cannel carbonised during the year was 126,259 tons, and the quantity of gas made was 1,298,201,000 cubic feet. The average illuminating power of the gas at all stations was equal to 18.92 standard sperm candles. The demand for supply current for the electric light had increased considerably during the year, and the committee in December last reduced the charges from 6d. to 4d. per unit for lighting, and from 4d. to 2d. per unit for motive power. As this was an exceedingly low price, it was anticipated that it would induce a larger demand for current. The number of lamps equivalent to eight candle-power now connected with the mains was 11,467. The electric light is to be also installed in the town hall at a cost of 724l.

### VARIETIES.

A NEW bridge connecting Norfolk and Lincolnshire has been erected over the river Nene, at Sutton Bridge, near Spalding, by the Midland and Great Northern joint railways. It is an iron swing-bridge for both road and railway traffic, and with contingent alterations at Sutton Bridge will cost the railway companies a sum approaching 100,000l.

SIR JOHN JONES JENKINS, M.P., president of Swansea Exchange, presided on the 8th inst. at a luncheon to inaugurate the opening of the new buildings erected in Fisher Street, at a cost of 4,000l.

THE Barton House Estate, South Warwickshire, comprising an original Jacobean mansion, built by Inigo Jones in the year 1615 for Sir James Overbury (a brother of the Sir Thomas Overbury who was poisoned in the Tower in the reign of James I.), with its estate of about 750 acres, has been sold by Messrs. John D. Wood & Co., of Mount Street, for 27,200l., including the valuable timber.

AN illustrated programme of the Royal Jubilee Procession, authorised by H.R.H. the Prince of Wales, will be published in aid of His Royal Highness's Hospital Fund for London, to which the entire profits will be devoted. The

programme will contain detailed particulars of the procession, and sixty-four pages of illustrations will run throughout the pamphlet, with descriptive letterpress underneath. It will be published at one shilling, and will be on sale four or five days before the day fixed for the procession, and will form not only an illustrated guide, but an interesting memento of the day.

BALGRIFFEN PARK, the residence of Major Doyne, situate between Raheny and Malahide, in North County Dublin, was totally destroyed by fire on Tuesday night. The house was one of the oldest in the northern part of county Dublin, and the woodwork was of exceptionally heavy construction, the floors being of 3-inch planking and the beams of pitch pine. Balgriffen is the estate conferred by Henry VIII. on Conn Bacach O'Neill, when the king was engaged in an attempt to convert Irish chiefs into noblemen of the pale. Along with the estate O'Neill received the title of Earl of Tyrone. Both the earldom and the estate ultimately fell to the celebrated Hugh O'Neill, Earl of Tyrone.

A NEW vehicular bridge over the river Dee, which has been built at a cost of 13,000l. by the County Councils of Flintshire and Cheshire, the Dee Conservancy Board and other authorities, to take the place of a primitive ferry which for many years has been inadequate to cope with the requirements, was opened on June 2 by Mr. Gladstone. The new structure, which is a handsome one, has three spans, the centre one of which opens by an ingenious telescopic movement to permit of the passage of vessels up and down the river. The bridge forms a convenient and speedy access from North Wales to Cheshire and Lancashire, and will be the means of further opening out the Principality to the markets of the great centres of commerce. It is free to foot passengers, but the Flintshire County Council are permitted to charge tolls for animals and vehicles in consideration of undertaking its maintenance.

### NEW CATALOGUES.

MESSRS. SHANKS & Co. have just produced a catalogue of their patent sanitary appliances for ships, which is an admirably got-up epitome of everything which can be required for the purpose. The illustrations portray a practically unlimited assortment of closets, lavatories, urinals, baths, &c., of which all prices are given.

ANOTHER concise catalogue of sanitary appliances which has reached us is that of Messrs. Thos. Crapper & Co., of

### TRADE NOTES.

WE learn that Messrs. Witherby & Co., of 325 High Holborn, W.C., are publishing for the Admiralty a Jubilee commemoration number of the Royal Navy List.

MESSRS. TYHURST & SON, of Uckfield, have forwarded us particulars of their patented improvements in kerbs, edging blocks, platform copings, steps, &c., which, made in strong, hard stoneware, should prove very valuable in positions where

they are likely to be subjected to great stress of wear and tear. The illustrations show a transverse section of a plain edging block or kerb of different shapes, which, as will be seen, are made with a roughened surface, which ensures a good foothold.

THERE is probably no monarch in the world who is so closely connected with other rulers as our own beloved Queen. So many and so varied are the relationships of our Royal Family that most people, while convinced of the fact, have only a vague knowledge of the actual details. Recognising this, the proprietor of *Mothers and Daughters* is giving away a

large chart showing the whole of the Queen's descendants, and the various inter-relationships of the Royal Houses of Europe so far as they are connected with our own Sovereign.

THE new hospital, Dagenham, Essex, is being warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves with descending smoke-flues.

### SIGNALLING THROUGH SPACE.

AT the Royal Institution on Friday, the 4th inst., Mr. W. H. Preece delivered a lecture on "Signalling through Space without Wires." He described the method he himself had worked out of sending signals from one place to another without intervening wires. In this system, which made use of electromagnetic waves of low frequency, two parallel circuits were established, one on each side of a channel or bank of a river, each circuit becoming successively the primary or secondary of an induction system according to the direction in which signals were to be sent. Strong alternating currents were transmitted in the first circuit, so as to form signals in the Morse code. The effects of the rise and fall of these currents passed as electro-magnetic waves through the intervening space, and if the secondary circuit was so situated as to be washed by these ethereal waves their energy was transformed into secondary currents, which could be made to affect a telephone. This system was successfully used in 1895 to telegraph across the Sound of Mull when the submarine cable had broken down. With reference to the distance to which it was possible to signal in this way, the lecturer mentioned that the curious law had worked itself out that the length of each of the two parallel circuits must be equal to the distance between them. Last year an attempt was made by this method to establish communication with the North Sandhead Lightship on the Goodwin Sands. A cable was coiled in a ring on the bottom of the sea, embracing the area over which the ship swung, and the ship itself was surrounded with another coil above the water line. Communication, however, was found to be impracticable, because the screening effect of the sea-water and the effect of the iron hull of the ship absorbed all the energy of the currents in the coiled cable. Last July a young Italian brought a new system to England, in which Hertzian waves of very high frequency were utilised. The peculiarity of Mr. Marconi's system was that apart from the ordinary conducting wires of the apparatus, conductors of very moderate length only were needed, and even these could be dispensed

with if reflectors were employed. The transmitter was Righi's form of Hertz radiator, consisting of two spheres of solid brass, 4 inches in diameter, fixed in an insulated case fitted with oil, in such a way that a hemisphere of each was exposed, the other hemisphere being immersed in the oil. The oil kept the surfaces of the spheres electrically clean, it impressed on the waves excited a uniform and constant form, and it tended to reduce the wave-length. Mr. Marconi generally used waves about 120 centimetres long. This radiator was excited by an induction coil controlled by a Morse key. A 6-inch spark-coil had sufficed for distances up to 4 miles, but for greater distances a larger coil had to be used. The receiver consisted of a small glass tube 4 centimetres long, into which two silver pole pieces tightly fitted, the  $\frac{1}{2}$ -millimetre space between them being filled with a mixture of fine nickel and silver filings mixed with a trace of mercury. The tube, which was exhausted to a vacuum of 4 millimetres, formed part of a circuit containing a local cell and a sensitive telegraph relay. In its normal condition this metallic powder was virtually an insulator; but when electric waves fell on the particles they were marshalled and arranged in such a way that they became a conductor. Hence a current passed which could be used to ring a bell or indicate a signal in other ways. But in order to apply this device to practical work it was necessary to have some means of again rendering the filings non-conductive, and this Marconi managed by making the local current vibrate a small hammer-head against the glass tube, thus shaking the filings back into an insulating condition. This receiver Mr. Preece declared to be about the most delicate electric instrument we possessed. By its aid signals had been transmitted across the Bristol Channel between Penarth and Brean Down, a distance of nearly nine miles. With reference to the employment of this device in the public service, he pointed out that secrecy could be perfectly maintained by its use. If a receiver was to respond to a certain transmitter it must be tuned to accord with it, and unless it were so timed it would be unaffected. It was curious that hills and apparent obstructions failed to obstruct the effects, nor did weather seem to have an influence, while one apparent anomaly which had developed itself in the course of Mr. Marconi's experiments was that his receiver acted even when enclosed in a perfectly closed metallic box. In conclusion, the lecturer declared that, though there were still many practical points that required to be threshed out in this system, enough had been done to prove its value and to show that for shipping and lighthouse purposes it would be a valuable acquisition.

## THE UNIVERSITY OF NEW SOUTH WALES.

A CORRESPONDENT of the *Scotsman* in Sydney writes:— Sydney possesses a University which in some respects may be spoken of as an institution with few equals in the world. It stands in a picturesque position, it has been arranged with admirable care and forethought for the purposes of study, it opens its doors to all comers who have got the necessary qualifications, and it is conducted with an amount of energy and spirit not often to be found in older institutions. The main building of the University stands upon an eminence between the suburbs called Newtown and Forest Lodge. An extensive park surrounds it. Part of that park is really a great pleasure ground; another part is the site upon which the affiliated colleges stand. If you stand at the front of the University you have a really magnificent panorama before you. A great part of the city of Sydney is in full view; you are looking down upon it. You see the harbour glittering in the sunshine; you see the hills to your right and to your left covered with foliage. Immediately at your feet lie the pleasure grounds which by the care of the managers of the University have been made to blossom with flowers. Here again you have the scarlet hibiscus all aflame in the midst of shrubs of various kinds; you have the oleander and the mimosa, and the Japanese lily, and many other plants of a tropical or sub-tropical kind. It is a scene not soon to be forgotten; and it must have something of an elevating effect upon the students of the University.

Behind the main building other erections have been put up. The main building is of stone, the other buildings are mainly of brick, the idea being that, as they will need extension in the not very distant future to meet the requirements of the increasing number of students, it was cheaper to build them at first of brick, and being of brick they are more easily removed than they would be if they were built of stone. Here you have a great museum, you have classrooms and laboratories for the medical, the engineering, and all the scientific departments. The arrangements of these classrooms seem to be excellent. They have taken the place of older and smaller classrooms which were not arranged with anything like the same care for the purposes of teaching.

It is intended before long to erect as an adjunct to the main building a new library and museum which will contain most of what is now held in other and less permanent buildings. When it is completed, with its cloisters and its fine library, the University building will have few equals elsewhere.

As far back as 1858 the University was incorporated by an Act of the Colonial Legislature. It was then endowed with an annual income of 5,000*l.* Since 1882 various supplementary grants have been made, the amount in 1895-96 being about 4,000*l.*, besides special grants for special purposes. The charter of the University declares that its object is to supply the means of a liberal education to "all orders and denominations without any distinction whatever." There is no Faculty of Theology in the University, but there are lecturers in modern languages, as well as in all the ordinary branches of University teaching. Obviously, as there is no Faculty of Theology in the University, there might be objections on the part of some of the religious bodies. These objections have been removed by the establishment of colleges in connection with the different religious denominations. This was provided for by an Act of the Legislature in 1854 before the University itself received its charter. Assistance is given to their endowment, and the fundamental principles of the University—the association of students without respect of religious creeds in the cultivation of secular knowledge—is secured consistently with the most perfect independence of the college authorities within their own walls. These colleges, which stand within the grounds of the University itself, are St. Paul's College for members of the Church of England, St. John's College for members of the Roman Catholic Church, St. Andrew's College for members of the Presbyterian Church, and the Women's College. Mention of this last institution recalls the fact that women have for many years past been admitted to the University on an equal footing with the men. They are taught in the same classes by the same professors or lecturers, and are entitled to receive the same degrees if they show competency in their work.

### A LEGITIMATE BRIDGE FAILURE.

MILL BROOK, a small stream in Raritan Township, N.J., has for several years, says the *Engineering Record*, been crossed near Bonhamtown by a brick arch bridge about 25 feet wide and of 14-foot span. It was recently determined to widen the bridge, and a contract was let for the extension of the old structure about 20 feet transversely to the roadway, by building another section of arch and walls "like the original ones." Between 300 dols. and 400 dols. was allowed for the work, and

the original contractor sublet the job to a second party, who constructed the brick side walls, 4 or 5 feet high, and from their tops sprung the new arch. This was a very flat segment with sharp curve at the haunches, and was supported on skewbacks made of broken brick, spawls and mortar. The arch ring was three bricks thick laid in poor cement mortar. Earth was filled in behind the retaining walls and the arch was finished and its centres immediately struck. The removal of the centres was accomplished on the evening of May 1. Considerable rain fell the following night, and surface water flowed down the steep hill at the end of this bridge and over the new fill and work.

On May 2, while two persons were crossing the bridge, the new part fell without warning and killed one of them. The brickwork was found badly disintegrated, the mortar still soft and wet, and where the old and uninjured work had joined the new there was a perfectly smooth finished surface where the new section had merely abutted against the old without any pretence of bonding, toothing or other connection. The fatality attending this bridge failure again calls attention to the criminal carelessness often permitted on work of this character in country communities where an expenditure for intelligent design and honest superintendence is regarded as superfluous. The county will probably now have to pay a money penalty for the short-sighted economy of its officials.

### MINES AND QUARRIES IN 1896.

SUMMARIES of statistics for the year 1896 relating to the mines and quarries of the United Kingdom and the Isle of Man have just been issued as a blue-book. They show the number of persons employed, the quantities of minerals raised, the number of fatal accidents and deaths, the number of non-fatal accidents and persons injured and the death-rates from accidents in each inspection district. During the year 1896 the total number of persons employed in and about all the mines of the United Kingdom was 725,803, of whom 692,684 worked at the 3,385 mines under the Coal Mines Act and 33,119 at the 731 mines under the Metalliferous Mines Act. Compared with 1895 there is a decrease of 7,600 persons at mines under the Coal Mines Act, and a decrease of 254 persons at mines under the Metalliferous Mines Act. Of the 692,684 persons working at mines under the Coal Mines Act 557,026, or about 80 per cent., were

employed below ground. Of the 135,658 surface workers 4,517, or about 3·3 per cent., were females. At the mines under the Metalliferous Mines Act 19,299 persons, or about 58 per cent., worked below ground, and of the 13,820 surface workers, 597, or nearly 4·3 per cent., were females. At quarries there were 112,829 persons employed, of whom 56,123 worked inside the actual pits or excavations, and 56,706 outside. The persons employed occasionally at quarries are not included. The total output of minerals at mines under the Coal Mines Act was 208,503,868 tons, of which 195,351,951 were coal. Adding 9,309 tons from open quarries, the total output of coal was 195,361,260 tons, which exceeds that of the previous year by 5,708,698 tons. It is the highest output yet recorded. The total output of minerals at mines under the Metalliferous Mines Act was 3,873,697 tons, of which 2,237,327 tons were iron ore. The total quantity of stone and other minerals obtained from quarries was 35,641,411 tons. At the mines under the Coal Mines Act there were 849 separate fatal accidents, causing 1,025 deaths. Compared with 1895 there was a decrease of 19 in the number of accidents and a decrease of 17 in the number of deaths. At the mines under the Metalliferous Mines Act there were 37 fatal accidents, which caused 40 deaths, showing a decrease of 9 in the number of accidents and 14 in the number of deaths. At the quarries there were 117 fatal accidents, which resulted in 124 deaths. Compared with 1895 there was an increase of 15 in the number of accidents and 22 in the number of deaths. The number of non-fatal accidents reported during the year amounted to 5,520 at mines under the Coal Mines Act, 308 at mines under the Metalliferous Mines Act and 896 at quarries under the Quarries Act. The death-rate in the midland district was far lower than that of any other inspectorial division. The death-rate from accidents of the underground workers at the mines under the Coal Mines Act was 1·619 per 1,000 persons employed, and that of the surface workers ·907 per 1,000 employed; the corresponding figures for 1895 were 1·655 and ·877 respectively. At the mines under the Metalliferous Mines Act the death-rate of the underground workers was 1·710 per 1,000 persons employed. There was a considerable improvement compared with that of 1895, which was 2·391 per 1,000; the deaths from accidents to surface workers showed a ratio of ·507 per 1,000. At quarries the death-rate of the workers inside the actual pits or excavations was 1·604 per 1,000, and of the persons at factories and workshops outside the quarries, but connected with them, ·600 per 1,000.

### THE NEW BIRMINGHAM WATERWORKS.

IT is now five years, says the *Birmingham Daily Post*, since the passing of the Act of Parliament authorising the construction by the Corporation of Birmingham of an extensive system of works for impounding the waters of the Elan and Claerwen above the Rhayader, and conducting them to Birmingham for the supply of the necessities of the huge population, of which the greater portion is under the jurisdiction of the City Council. Parliament fixed a period of ten years for the execution of the undertaking, and it was entered upon with the least possible delay, contracts being let for some of the works, while the Corporation arranged for the carrying out of other portions by its own officers. Nearly three years ago, on July 10, 1894, the members of the City Council made a day's excursion to the Elan Valley. They were then shown the site of the reservoirs, the model village for the accommodation of the workpeople, certain railways that had been constructed for facilitating the removal of material and a variety of other preliminary operations. The general outlines of the scheme were explained, and the Council were able to appreciate more fully than had previously been possible the nature of the vast undertaking for which they and their advisers were responsible. Two features that were made additionally evident by the inspection were the admirable character of the gathering ground from which the water is derived, and, in the second place, the adaptability of the Elan and Claerwen Valleys for reservoir purposes by the construction of the proposed series of dams. There was little more to be learnt at that time, but in the period that has since elapsed material progress has been made with the works—practically, they are nearly half through—and the water committee considered it desirable that in the present spring a second visit should be made by the whole body of the City Council. May 27 and 28 were fixed for the inspection, two days being none too much for the ground which had to be covered.

The undertaking naturally divides itself into two sections. First, there is the damming up of the head waters into reservoirs capable of providing for a supply of from twenty-six million to twenty-seven million gallons per day, or ultimately seventy-five million gallons per day; and, secondly, there is the provision of the means for conveying this water through hill and dale to the confines of Birmingham. The first day was accordingly devoted to the inspection of the nature of the conduit works and the progress that has been made in their

construction. For this purpose the party were taken to the picturesquely-situated town of Knighton, in Radnorshire. Knighton is approximately at a third of the distance from the Elan Valley to Frankley, near Northfield, where the construction of a storage reservoir will shortly be commenced. Nothing has yet been done on the Birmingham side of Knighton, but on the Welsh side the works are making rapid progress. The party numbered fifty-one members of the City Council, representatives of the Press and a number of principal officers of the Water Department. Under the guidance of Mr. Mansergh, they made their way up the somewhat steep road of the Garth Hill to a building standing prominently on the hillside. This was the inlet valve house of the Downton syphon, and here explanation was given of the manner in which the water is carried across the deeper valleys by which the course of the conduit is intersected. Knighton is in the valley of the River Teme, and the hills rise upon either side to a considerable height. The conduit from the reservoirs, which is being constructed with but a slight gradient—a fall of 44 feet in 27 miles—meets the valley of the River Teme at a point where, for the next 9 miles towards Ludlow, a variety of elevations and depressions have to be passed, but all of them lower than the point on the hillside already indicated. For this purpose the water tunnel is replaced by lines of iron pipes, which descend the depressions and ascend the elevations a short distance beneath the soil, the downward pressure on the one side causing the water to find its level upon the other. This arrangement is called a syphon, whether intended to cross a single valley or a long series, and there are several such syphons of greater or less magnitude between the Elan reservoirs and Frankley.

The party having reached the syphon-house descended some temporary ladders into what looked like a sort of cellar with blue brick sides and vaulted roof of concrete. "Now, gentlemen," said Mr. Mansergh, "I just want to describe in a few words where you are and what this arrangement is." The "arrangement" proved to be a very simple and intelligible one. A tunnel, which the visitors were afterwards to traverse for a mile and a quarter before they saw daylight again, was explained to be a section of "cut-and-cover" conduit. That is to say, it is sufficiently near the surface of the ground to be constructed by cutting a trench, building an invert and sides of blue brick and cement, backed by concrete, and then covering it with an arched roof of concrete, upon which the soil is ultimately replaced. Towards the valley of the Teme this tunnel

widens out into a chamber, of which the outer face has six iron doors on the ground level. They are rounded at the top, and, except that they worked in slides, portcullis fashion, and not upon hinges, they resembled the openings of a baker's oven. These gates are intended to regulate the admission of the water to a series of six cast-iron pipes 42 inches in diameter, and which compose the 9 miles of the Downton syphon. The chamber, as already stated, is prepared for six pipes, which would deliver 75,000,000 gallons of water per day, but this quantity will not be needed until some distant day. For immediate needs two pipes only are being provided both at this point and at others where the aqueduct consists of pipes, and these will suffice to deliver from 26,000,000 to 27,000,000 gallons per day. There is an arrangement whereby any excess of water in the chamber passes over a sill at the top into an overflow pipe to the river, and in case of either of the pipes of the syphon bursting under the pressure an ingenious device has been provided whereby the increased rush of water would result in the automatic closing of the gate to the damaged pipe, thus avoiding any flooding or damage in the valley.

Having been duly informed of these details the party started on their walk through the mile of covered conduit, light being afforded by several lamps carried by members of the engineering staff. It was not altogether an unpleasant journey, the passage having a height of 8 feet and a maximum width of slightly over this, the sectional form being somewhat pear shaped. There was very little wet upon the invert, the walls were beautifully clean, and the atmosphere was cool and pleasant. The conduit follows the course of the hillsides, curving first one way and then another, while here and there are short lengths of square sections constructed with the aid of binding girders, and carried upon arches across small valleys or dingles. One such section was exposed to view near the spot where the party emerged into the open air, and it was pleasing to observe that these arched sections were constructed of a reasonably decorative design, and formed no detriment to the native scenery. The next section explained consists of tunneling through the hills. The visitors were shown the commencement of what is called the Knighton tunnel, extending from a mile and a quarter beyond Knighton to the Lugg Valley, a distance of two miles and a half. Mr. Mansergh explained that this tunnel was being driven from each end, 1,700 yards having already been run from the Knighton end and 1,600 yards from the other end, leaving about 1,000 yards still to pierce before the two sets of excavators meet.

REPRODUCTIONS OF

**The FINEST EXAMPLES**

Ascending a steep bank, the visitors made their way to the main road, where a number of open vehicles awaited them, and in which they were taken a drive of about a hour and a half to Dolau Station. The route forms one of the pleasantest drives in the Principality, lying through a constantly changing landscape of rolling hills, many of which are beautifully wooded, while others show smooth heather-topped moorlands of varying tints. At intervals are small picturesque villages, and here and there the farmsteads of prosperous agriculturists. The first stopping-place was the Lugg Valley, where there is another syphon constructed to carry the water past a depression of about a third of a mile in width. Descending to the syphon chamber, a long table, illuminated by candles, was found, just within the covered conduit, and spread with light refreshments, by way of luncheon. From this point there is a further length of two miles of cut-and-cover conduit almost finished, and leading to the Dolau tunnel, a piercing  $4\frac{1}{2}$  miles long, which is to extend very nearly to the reservoirs. On the way opportunity was afforded for inspecting three shafts formed at intervals along the Dolau tunnel for discharging the excavated material. Part of the tunnel is at no great depth below the surface, but the greater length penetrates a hilly ridge, of which the summit is about 600 feet above the level of the tunnel. The day's inspection ended at Dolau, whence train was taken to Llandrindod Wells, where quarters were provided for the night, partly at the Pump House Hotel and partly at neighbouring boarding-houses.

The next morning an early start was made by train for Rhayader in order to inspect the works at the Elan Valley, of the magnitude of which few only of the party had previously any conception. The weather was again fine, and the inspection proved both instructive and enjoyable. From near Rhayader Station a walk was taken over the line of the conduit to the Caethon syphon, near to which Alderman Lawley Parker (chairman of the water committee) met the party, and was warmly welcomed and congratulated on the measure of recovery he has made from his late illness. On the way attention was called to an air-valve at one of the higher points of the pipes intended to allow of the escape from the syphon of any imprisoned air, which would otherwise retard the flow of the water. There is provision of this kind at the summit of all the syphons, while, on the other hand, there are at the important depressions wash-out valves for the removal of any earthy matter carried down by the water. Crossing the Caethon stream, the visitors found awaiting them on the Corporation railway a

train of trucks, in which rough seating had been constructed. In these a journey was made of about 6 miles to the head of the Elan Valley, passing the whole chain of three reservoirs into which the valley is being converted. Stoppages were made at points of interest, and explanations were given of the construction of the dams. The lowest of these, at Caban Coch, was quickly reached. Caban Coch (the red cabin) forms, as it were, a natural gate to the valleys beyond. The Caban dam will be remarkable not so much for its lateral extent as for its height, which from the river bed will be no less than 122 feet, exclusive of the foundation. The thickness of the dam at its base is practically the same as the height, and while a nearly upright face will be presented to the reservoir, the outer side will be a flowing curvilinear slope. The length of the dam from side to side at the top will be about 600 feet. The excavation and the work already done is not so impressive viewed from the railway above, but the immense size of the dam is more apparent upon a descent to the river-bed and into the huge stack of timber that has been built to shut out the river from about half of its course while the first part of the masonry is built. The Lord Mayor, Alderman Lawley Parker and others so descended for the purpose of laying a stone in the face of the outlet from a culvert piercing the dam at this point, and which has a diameter of 16 feet. The foundations of this work have been put in, and the lower half of the culvert already constructed. Of course there must be no stopping back of the river until the entire dam is finished, but while the work is going on provision must be made for letting past the huge volumes of flood water which pour down after a few hours' storm. This is the purpose of the culvert. A portion of the dam, including one culvert, has first to be built, then a portion of the river will flow through it, while another enclosure is started out near the opposite bank with a second culvert. Then when there are two of these large culverts the centre portion of the dam can be built. Next, pipes will be laid through the culverts capable of paying into the river compensation water to the amount of 27,000,000 gallons a day. Last of all, the culverts, except the compensation water pipes and their valves, will be closed by a breastwork of steel plates and concrete.

The result of these operations will be that an accumulation of water, having a depth in places of as much as a hundred feet, will back up the valleys of the Elan and the Claerwen, forming a lake something like a letter Y in shape, and having a length up the longest arm of nearly four miles. The capacity of this Caban Coch reservoir will be eight thousand million

**Park Row, Nottingham.**

gallons. We put that fact on record as a matter of figures, but an idea of the magnitude and character of the reservoir can only be obtained by an actual view of the ground to be submerged, and even then it is difficult to realise that the waters will rise to the height indicated by various landmarks put up for the occasion of the visit, and in time of flood will flow over the top of the dam in a cataract 3 feet in thickness.

During the journey by rail, high along the hill sides, but only 13 feet above what will be the top water level, attention was directed to various quarries on the opposite side of the valley from which huge blocks of hard, blue-tinted limestone are obtained, and to appliances for crushing material to blend with Portland cement into the concrete, of which vast quantities are employed. At the head of the site of the Caban reservoir the valley shallows towards the level of the railway, and as the ground becomes higher there is less cultivation until the landscape closes with smooth, rounded hills, with scanty turf, sufficing only for the sustenance of the hardy mountain sheep. Work is well forward in connection with the dams forming two higher, but smaller, reservoirs—that of Pen-y-Gareg and Craig Goch. Though smaller than the Caban reservoir, they will be lakes of considerable extent, the former having a capacity of 1,330 million gallons and the latter of 2,002 million gallons. Three other reservoirs in the Claerwen Valley are included in the scheme, but will only be constructed if the growth of the demand for water renders them necessary.

While the party were at the head of the valley, the Town Clerk, pointing to the gathering grounds beyond, said he would mention a few particulars as to the extent of the Welsh estate which the Birmingham Corporation had acquired. It reached for another six miles further ahead, ten miles to the left of where they were assembled, and perhaps two to the right, the whole area being 45,000 acres, or seventy-one square miles. Thirty-five thousand acres of this had been actually bought, and as regarded the other 10,000, it might not be necessary to purchase, as they had already acquired the manorial rights in order to prevent pollution by lead-mining. The Corporation were also the owners of 13,000 sheep, and were, he believed, the largest sheep farmers since Abraham. On the return journey explanation was given of the submerged dam, which stops back a sufficient portion of the water in the upper half of the Caban reservoir to allow of its being tapped at an adequately high point to flow to Birmingham on what is called the hydraulic gradient. The rate the water will travel is rather less than two miles an hour, so that a particular portion of the stream through

the aqueduct would complete its journey in a day and a half. Among other circumstances learnt at the excursion is that the actual expenditure of the committee up to the present time is a million sterling, while contracts have been given out for work estimated at another half million. Taking one portion with another, the estimates so far have proved trustworthy. The procedure of the committee has been to put in hand first the operations involving the most time and the greatest difficulty, so that the whole may finish together in 1902. Mr. Yourdi, the engineer in charge of the Caban Coch dam, expects that under favourable circumstances his work will be completed in 1901.

### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

#### APPLICATIONS FOR PATENTS.

12753. Frederick William Pinson, for "Improvements in the construction of padlocks."

12804. Winfield Scott Pettit, David Reed Pettit and Edward Devaul Sutton, for "Improvements in window-sash fasteners."

12824. Gustav Bortmann and Reinhold Munkwitz, for "Improvements in doorsteps."

12830. Stephen McClellan, for "Improvements in frames and other attachments for bit braces."

12835. Christian Heidecke, for "Improvements in or relating to tools for operating upon stone, metal, wood and other materials."

12864. Stephen Arnold Pearson, for "Automatic flushing arrangement."

12871. John Edmundson, for "Improvements in hanging window sash and in the pockets of sash window frames."

12879. George Basker, for "Locking or fastening device for fanlights."

12903. Harriet Tidswell, for "Improvements in window sash-fasteners."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

# THE NEW EXPANDED METAL

Mesher from  $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to  $\frac{1}{8}$ th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

TRADE NOTES.

THE Linslade Rural District Hospital, Leighton Buzzard, is being warmed and ventilated throughout by means of Shorland's patent Manchester grates, patent exhaust roof ventilators and special inlet panels.

THE Papermakers, Printers, Stationers Bookbinders, Fine Art Publishers and Photographers' Exhibition, which is to open at the Agricultural Hall on June 23 to June 30, promises to be of more than usual interest, as several specimens of the most modern printing machinery, both American and English, will be on view, in addition to the numerous machinery exhibits in operation.

MESSRS. NIGHTINGALE & Co., of Great Grimsby, have recently had to add very considerably to their wood-working machinery, to enable them to cope with their increasing wood-block flooring business. Their factory is now replete in all respects with apparently every modern appliance, consisting,

as it does, of extensive storage and large drying store or kiln, and machinery of the newest and best make, thus rendering the works one of the best and most compact factories of its kind. The building is situated direct on the M. S. and L. Railway Company's wharf, and will enable the company to give all their orders the utmost despatch. The company holds carefully selected stocks of the best descriptions of Baltic and White Sea fir, also pitch-pine, oak, jarrah, teak, mahogany, and other various woods suitable for their requirements. We understand from Mr. Whiteing, the manager, that they have a large number of orders in hand, and amongst them may be mentioned the Manston Asylum for 3,472 yards oak flooring, National Provincial Bank of England at Leeds, the generating station for the Leeds City Corporation, in connection with their new scheme of electric tramways; the Elmsfield College at York, besides many other contracts of various kinds in all parts of the kingdom, amongst which may be mentioned the city of York contract for the year's supply of paving blocks required for street work.

BUILDING AND BUILDERS.

THE foundation-stone of a new Protestant church for Arklow, the gift of Lord Carysfort, and which is to cost 25,000*l.*, was laid by the Countess of Carysfort. The new church occupies a prominent site near the railway station, and is to accommodate 500 people.

THE Primitive Methodist Sunday school in John Street, Sheffield, is to be enlarged. The work is estimated to cost about 2,000*l.*

THE foundation-stone of the new Corporation baths, now in course of erection in East Hull, was laid on the 10th inst. The new building will be in the Renaissance style of architecture. The men's swimming bath is 96 feet by 30 feet, and the depth of the water 6 feet 6 inches. In the boys' bath the size will be 60 feet by 30 feet, and the depth from 3 feet to 4 feet 6 inches. There will be thirty-one private baths, a laundry and wash-house. All the most modern improvements have been adopted, and when completed the new baths will undoubtedly be the best equipped in the county.

THE foundation-stones of a new Wesleyan Methodist chapel at Ecclesfield were laid on the 9th inst.

THE foundation-stone of Dudfield Memorial Hall, to be erected contiguous to and in connection with the Lansdowne

**W. WATSON & SONS, 313 HIGH HOLBORN, LONDON, & 78 SWANSTON STREET, MELBOURNE.**

Place Ragged School and Mission, Tabard Street, Borough, was laid by Earl Compton, M.P., on the same day.

THE Marquis of Dufferin laid on Wednesday the commemoration-stone of the new harbour at Hastings. The Hastings Harbour Act received the Royal Assent in August 1890, but owing to the difficulty of raising the money the work was not commenced till May of last year. Up to the present time 60,000*l.* or 70,000*l.* have been expended on the works. The original idea was to have a harbour 18½ acres in extent, but that in process of construction will be 27½ acres. The western arm is half built, and when finished will be 1,760 feet in length; the eastern arm will be 1,000 feet long and the mouth will be 300 feet wide. The harbour is situated at the east end of Hastings, and the depth of water at the mouth will be 14 feet at low spring tide, and to a considerable distance landwards 12 feet, whilst the shallow will be 5 feet deep. The rise and fall of the sea level will be 20 feet, and it is stated that any steamer used for crossing the Channel will be able to enter the basin at any time. It is hoped that the western arm will be so far completed by the early spring of next year that the Commissioners will be able to begin trading. The Harbour District Railway Bill, now passing through Parliament, will connect the harbour with both the South-Eastern and London, Brighton and South Coast Railways. It is hoped that the works of the new harbour, which will be of inestimable value to Hastings, will be sufficiently advanced to enable it to be used next year.

### ELECTRIC NOTES.

THE lighting committee of the Wolverhampton Corporation have issued their annual report with regard to electric lighting, which shows that a net profit has been made of 225*l.* 14*s.* 5*d.*, which has been applied to the deficiency on the working of the previous years. The total quantity of electricity generated was 287,507 Board of Trade units, of which 224,709 were sold, and 60,820 were unaccounted for. The quantity sold for the lighting of the streets was 73,466 units, for which 1,242*l.* 5*s.* was received, while the sale to private consumers realised 3,778*l.* 18*s.* 6*d.*

THE Liverpool lighting committee have decided to recommend the Council to make the following extensions in the electric mains of the city:—Granby Street, at an estimated cost of 683*l.*; Park Road and Cornhill, at an estimated cost of 337*l.*;

Oxford Street, at a cost of about 118*l.*; and Smithdown Road, at an expenditure of something like 60*l.* The committee received an intimation that the Municipal Electrical Association intended visiting Liverpool on July 1 for the purpose of inspecting the electric lighting stations and the arrangements existing in the city for the supply of the electric light. The necessary permission for the inspection was granted.

THE gas committee of Dundee Town Council met last week for consideration of the tenders for a new engine and dynamos, a new boiler, arc lamps and accessories, and a new battery. It was agreed to recommend the following offers for acceptance:—For engine and dynamos, Siemens Brothers, London, 1,505*l.*; boiler, Cooper & Greig, Dundee, 493*l.*; and arc lamps and accessories, Crompton & Co., London, 332*l.* 4*s.* It was resolved to recommend the purchase of two new batteries, the contractor taking the old plant. On that footing the offer of the Electrical Power Storage Company, Limited, London, amounting to 1,112*l.*, was accepted. A large number of beautiful designs were submitted for street arc lamps. After lengthy consideration, two styles, in respect of price and design, found most favour with the committee, and it was agreed to recommend the Town Council to erect one of each pattern, in order that the members of Council and public might have an opportunity of making a satisfactory selection.

AT a private meeting of the Crief Town Council, held in the County Court-room on Monday evening, Provost Finlayson submitted a report dealing with the progress of the electric-lighting scheme at Fort William. The Provost intimated that recently he had been through the works at Fort William, that he had seen the system in operation and that he had interviewed several of the leading residents in regard to the scheme. After some discussion, during which the Provost was questioned regarding the cost of installation, &c., the Board decided to consider the matter further. Sir Patrick Keith Murray, Bart., of Ochertyre, has offered a free supply of water provided the scheme is proceeded with.

THE firms of specialists who have made arrangements for undertaking electrical works have been increased, for Messrs. S. Newton & Co., of High Street, Clapham Road, announce that they can undertake complete light and power plants, shop and private lighting, &c. They have already succeeded with several important installations, and on that account they can with confidence look forward to obtaining public support from all who desire excellent work.

CATHEDRAL SERIES.—ST. PAUL'S: WEST FRONT.—CHOIR, LOOKING EAST.—NAVE, LOOKING WEST.—SOUTH AISLE OF NAVE, LOOKING WEST.

## VARIETIES.

THE parish church of Heeley, near Sheffield, was reopened after renovation and enlargement on the 13th inst.

A NEW village hall substantially built, plainly decorated, suitably lighted and ventilated, and seated for 250, was opened on the 11th inst. at Bowden, near St. Boswells.

THE Paddington Vestry propose paving certain main streets in their district with hard Australian wood, at a cost of 13,751*l*.

A FIRE broke out at the Huyton post office, near Liverpool, on Saturday morning last. The post office was destroyed. An adjoining confectioner's shop was completely gutted, and a bootmaker's premises were partially destroyed.

THE work of increasing the accommodation at the church dedicated to St. Philip the Evangelist, at Dorridge, Knowle, has been completed, and on the 16th inst. the ceremony of dedicating the new portion took place. The total cost of the completed edifice will be between 5,000*l*. and 6,000*l*.

THE Archbishop of York has arranged to open for the Missions to Seamen a new fishermen's institute at Scarborough as a local Diamond Jubilee commemoration early in August. It is to cost 1,500*l*., besides gifts in kind for furnishing.

THE Masonic Hall which has been erected at Carrick-on-Shannon to the memory of the late Surgeon-Major Parke was on the 9th inst. formally opened and solemnly dedicated to the uses of Masonry.

THE restoration of the west front of Peterborough Cathedral is rapidly approaching completion, but it will not be finished in time for the Jubilee commemoration service.

THE John Robinson Memorial Church which has been erected at Gainsborough at a cost of 7,000*l*. was opened on the 9th inst.

THE new Tivoli Theatre at Dover, which was opened on the 14th inst., was designed by the late Mr. C. J. Phipps. The house is fireproof, has accommodation for 1,000 persons, and all seats command a good view of the stage.

PLANS have been approved for the Convalescent Home for Frenchmen in Arundel Road, Brighton, and for a new road between Arundel Road and Arundel Street, to be called Courcel Road, after the name of the French Ambassador, Baron Alphonse de Courcel.

THE Brighton Town Council have decided to lay one-half of New Road with Jarrah wood blocks and one-half with Swedish deal creosoted wood blocks, while in North Street a similar experiment is to be made with Karri blocks and Swedish blocks.

A HANDSOME new reredos was dedicated at the parish church, Wirksworth, on Sunday morning. It is of oak and cedar wood, the figures being beautifully carved and coloured. The gift is a splendid addition to the interior of this ancient church.

THE erection of the marble sarcophagus to enclose the remains of the late Prince Henry of Battenberg in Whippingham Church, Isle of Wight, has this week been commenced from designs by Mr. Nutt, chapter surveyor at Windsor Castle.

THE Paisley Town Council have unanimously negatived a proposal to demolish the old prison in County Square. For fifteen years the premises have been unoccupied, and thirteen years ago they were purchased by the Town Council, who regard them as a fine specimen of the old baronial style of architecture.

THE Duke of Fife proposes that the burgh of Macduff should take over the harbour at the price of 13,000*l*.—8,000*l*. of which is to be paid when the transfer is made, and other 2,000*l*. to be allowed to lie as a loan on the harbour at the rate of 3*½* per cent. He offers the remaining 3,000*l*. as a donation in aid of the improvement scheme. The Town Council have agreed to call a meeting of traders to discuss the proposal.

A SERIOUS accident has happened at the new Ardgowan Distillery, at present being constructed in Ingleston Street, Greenock. Four men were at work on the roof of the mash-house, when through the slipping of a plank three of them were precipitated to the ground, a distance of 40 feet. Samuel Ross, foreman, was killed on the spot, and Francis Gallocher and Henry Jackson, labourers, were injured, the latter sustaining severe internal hurt. Gallocher and Jackson were removed to the infirmary. All three were from Glasgow, the foreman being a young man of twenty-four years of age.

MERRYWEATHER & SONS, LIMITED, 63 LONG ACRE, W.C.  
LARGEST MAKERS OF HIGH-CLASS HOSE IN THE WORLD. WORKS: GREENWICH, S.E.

THE covered wooden bridge across the Rhine from Rheinfelden, in Switzerland, to the Baden side of the river, took fire on Saturday last and was a volume of flames in a short time. The central arch which was very broad fell into the river without breaking and floated down stream a mass of fire; and on Monday the 300-foot-long wooden bridge across the Eisack, joining Bozen in the Tyrol with Loretto, caught fire at a spot where a passenger had thrown away a burning match and in an hour the entire structure fell burning into the torrent. A fireman fell with a burning rafter and swam on it some distance before he was saved. There is no means now of crossing the Eisack.

NEW day schools which have been erected in connection with St. Luke's Church, North Street, Leeds, were opened on the 12th inst. The schools have been built on the central-hall system, with the classrooms arranged on either side, those for the girls being on the side adjoining the old school buildings, and those to be used by the boys being on the east or lower side of the site. There are four classrooms, each 25 feet by 20 feet, and two 28 feet by 20 feet. The central hall is 60 feet by 28 feet, and at the south end, opposite the entrances, is a raised platform, divided from it by patent swivel partitions, so as to form a teachers' room, or a platform and stage when the central hall is being used for parochial or public purposes. Entrance to the schools is gained by two porches and lavatories, 18 feet by 16 feet, which are built close up to the Skinner Lane frontage. The building is heated by means of hot-water pipes and coils, and it is exceedingly well lighted by lofty mullioned and transomed windows. The lights to the Skinner Lane elevation are contained beneath pressed brick arches, the spandrels being filled in with diaper bricks to special design. The central hall is not only lighted by large windows in the gables, but by clerestory windows at the sides. The whole of the buildings are faced with pressed brickwork, and the playgrounds are concreted. The cost of the building per child is less than half the cost which obtains in the case of the Board schools in the city. The buildings have been erected from the designs and under the superintendence of Messrs. Smith & Tweedale, architects, South Parade. The cost is about 2,500/.

A NEW Wesleyan church, which has been erected in Waterloo Road, Smethwick, was opened on the 3rd inst. The church is built upon a site fronting Waterloo and Sycamore Roads, and is in the Early English Gothic style of architecture. It is constructed of brickwork, with stone dressings. The main entrance-porch faces Waterloo Road, and consists of a moulded

stone archway with stone columns having moulded caps and bases, and a stone carved pediment. A similar and separate entrance situated in the tower, and immediately adjoining, gives access to the gallery by a conveniently-arranged staircase. The plan of the church consists of nave, with lean-to aisles and chancel, in which seats are arranged for the choir. The organ-chamber is placed on one side of the chancel, and the minister's vestry upon the opposite side; also the choir vestry, with suitable lavatory accommodation. The seats upon the ground floor are arranged in three blocks, the largest being in the nave, and the remaining two situated on each side, separated by arcades to five bays, formed by moulded stone arches resting upon richly-carved caps, and circular columns having moulded stone bases. The church is about 90 feet in length, 45 feet in width (inclusive of aisles) and 31 feet high. The floor is laid to a gradient towards the pulpit. The seating accommodation is for about 650 persons. The building is well lighted by side aisle windows, and on each side of the nave above the arcading are arranged the clerestory windows, while over the gallery are arranged two three-light windows, with moulded stone mullions and tracery, with wheel-tracery window above the same. The chancel is lighted by a single four-light window, with stone mullions and open tracery in spandrels, and glazed with tinted cathedral glass in lead-work. The aisles have been laid with solid wood blocks, and the floors of the entrance-porch, lobbies, passage at rear of chancel, lavatories, &c., are laid with tessellated tiles. The oak pulpit is octagonal on plan, and has rich tracery panels. A leading feature of the exterior is a graceful stone spire springing from a tower situated next the main entrance, and rising to about 80 feet in height. The interior woodwork is of pitch-pine and red deal, stained and varnished, the roofs of nave, aisles and chancel, all of which are open framed, being oil-stained. The ventilation is efficient, and the heating, upon the low-pressure system, is by Messrs. Hoden & Son. The wrought-iron fencing and gas-fittings have been carried out by Mr. Edwin Glover, of Dudley Road. The stained-glass throughout has been supplied by Mr. T. H. Yates, of High Street, Smethwick. The builders were Messrs. J. Harley & Son, of Rolfe Street, Smethwick, and the architects are Messrs. Ewen & J. Alfred Harper, of Colmore Row, Birmingham. The cost of the structure is about 3,500/.

THE new booking-hall at Waverley Station, Edinburgh, which is rapidly approaching completion, is built from the plans of Messrs. Blyth & Westland, C.E., and situated immediately to the rear of the present ticket offices, is in the French Renaissance

## REAP'S PATENT DETACHABLE HANDLE TROLLEY.

For Banks, Warehouses and Newspaper Offices. Is used at the London and County Bank, at Head Offices and Branches; at the Alliance Bank, London and Lancashire Office, and at Messrs. George Newnes & Co.'s Newspaper Offices. These Trolleys are supplied with Rubber Corners to avoid collision with doors, fittings, &c., and can be placed in lift with handle removed. Particulars and Estimates on application to Sole Manufacturers, J. REAP & CO., Engineers, Ironfounders, and Pattern Makers, 16 Colindale Street, Southwark, S.E.

style, and measures 75 feet square, with a height of 30 feet, having a magnificent dome in the centre of the roof, surrounded by eight flat cupolas. Prudham stone has been used exclusively in the erection of the hall, the masonry being altogether substantial and displaying a large amount of carving and moulding. The woodwork of the roof is composed of wainscotted oak, the intervening panels being filled in with Tynecastle tapestry of pretty design and colour. The large centre cupola is of artistic design, the frieze being handsomely brought out with semi-relief figures in gold on a coloured ground. With regard to the flat cupolas, great care has been taken to avoid any chance of accident through falling glass, the architects having provided for the introduction of ornamental wrought-iron gratings, which have a very pleasing effect. The booking-office itself, which is placed in the centre of the hall, is also a handsome structure. It is in wainscotted oak, and richly carved in keeping with the general surroundings. Octagonal in shape, the office, in so far as convenience and suitability for its purpose are concerned, is probably the most complete of its kind in the country, as assuredly the booking-hall is as a whole. There are thirteen windows in the office, in the centre of which is the superintendent's room. The design of the mosaic tile flooring is costly and elaborate. The North British Railway Company's coat-of-arms is introduced at the four corners, with a border representing the Scottish thistle. Below the hall extensive cellars have been constructed. The lighting, heating and ventilating arrangements of the hall have been carefully attended to. The electric light will be used throughout, being worked from the roof of the building. Ferguson's patent Carlisle fireproof flooring has been freely used, and the outside protecting cupolas that lie over the flat ones are glazed with Pilkington's patent wired glass. The contractors for the booking-hall are Messrs. G. & R. Coussin, Alloa; the joiners, Messrs. Drysdale & Gilmour, Edinburgh; the tapestry decorations were by Mr. Scott Morton, Tynecastle Works Company, Edinburgh; while the mosaic tile floor was laid by Messrs. Doulton, London.

### BUILDING IN GLASGOW.

At the last fortnightly meeting of the Glasgow Dean of Guild Court there were thirty-five petitioners, and "linings" for property to the value of 100,000*l.* were granted. The chief "linings" were those granted to the Baltic Chambers, Limited,

who received permission to erect a block of offices in Wellington, Cadogan and Holm Streets, Glasgow, at a cost of 38,500*l.*; to the Rev. James Stalker, D.D., and the deacons, as trustees of Free St. Matthew's Church, Glasgow, who received permission to erect a church and hall in Garscube Road, Glasgow, at a cost of 5,000*l.*; to David S. Cargill, merchant, Glasgow, and the trustees of the Glasgow Church of Scotland Church Extension Association, who were granted a "lining" to erect a church and hall at the corner of Doncaster and Hinshaw Streets, Glasgow, to be called St. Cuthbert's Church; to the trustees of the Association for Infirm Children, who received permission to make alterations on East Park Home, Maryhill; and to the Glasgow Eastern Co-operative Society, who were granted a "lining" for tenements of dwelling-houses on the south-west side of Baltic Street, Bridgeton, Glasgow. The numerous remaining "linings" were mostly for tenements of shops and dwelling-houses in various quarters of the city.

### MR. BARNATO'S HOUSE.

IN one of the best positions in Park Lane the late Mr. Barnato, says the *Daily Telegraph*, elected to build his house. Some idea of the place can be given by saying that the freehold cost 70,000*l.*, the building 41,000*l.* more, and the interior decorations nearly 30,000*l.* It is a five-storey structure, built of Portland stone, and commanding one of the finest prospects in London, the Crystal Palace in one direction and Highgate in another. The work of preparing the site for the superb building which now attracts the notice of every passer was begun in October 1895, the actual building operations not being commenced until a few weeks later. Ten months after that the architect, Mr. T. H. Smith, and the builders, Messrs. Colls & Son, hoisted Mr. and Mrs. Barnato, with a party of friends, to the top with a crane, when the apex of the gable was successfully placed. The house includes a ball-room—a magnificent one, with 2,000 square feet of dancing floor—two drawing-rooms, a conservatory, winter-garden, dining, reception, morning and billiard-rooms, and a splendid hall. The first thing to strike the visitor is the grand marble staircase, with its statuary and ornaments, the wonderful balustrades and the dadoes in wainscot oak. This staircase is four flights in length, and is lighted by a glass dome in the top of the house. The style of the interior is Renaissance, tinged with the slightly more florid taste of Louis XIV., the characteristics of which are greater freedom of

ornamentation, ivory white and gold finishing being everywhere used, with a fine effect of lightness and elegance. Both the inside and the outside of the mansion might be described as a free treatment of the early Italian Renaissance, adapted to modern requirements, the statuary and carving being carried out in harmony with the style of the seventeenth century. All the floors are heated by hot-water radiators—this to conform to the late Mr. Barnato's ideas of comfortable temperature, acquired in a life principally spent in the tropics. An instance of the solicitude which the late millionaire always displayed for his children is shown by the plan of the special kitchen he had constructed for the little ones, with their bathroom, nursery and schoolroom on his own floor. Meantime the work of completing the mansion is going steadily forward.

### INDIAN INK.

In his last report on the trade of Wuhu, Consul Fraser says that the province produces the celebrated Indian ink, more correctly called China ink (*Encre de Chine*), used by artists who paint in water-colours. From Wuhu it goes to every part of China and all over the world. In 1895 about two tons of it were exported to foreign countries from Shanghai, valued at 564*l*. It may be made in other parts of China, but the best comes from the province of Wuhu.

The materials with which this beautiful black ink is made are the following:—(1) Sesamum oil, colza oil or the oil expressed from the large poisonous seeds of what Dr. Brett-schneider calls *Dryandra Cordata*, or *Elaeococca Verrucosa*, called by the Chinese *Wu Tung*, a tree extensively cultivated in the Yangtze valley and also well known in Japan; (2) varnish; (3) pork fat. The lampblack made by the combustion of these substances is classed according to the materials and the grade of fineness, and also according to the time taken over the process of combustion. The paste made of this lampblack has some glue added and is beaten on wooden anvils with steel hammers. Two good hammerers can prepare in a day eighty pieces, each weighing half a pound. A certain quantity of musk (of the musk deer), or of Baroos camphor, for scenting it, and gold leaves, are added; the latter, the quantity of which varies from 20 to 160 to the lb., being to give a metallic lustre. The materials thus prepared are moulded in moulds of carved wood, dried (which takes about twenty days in fine

weather), and adorned with Chinese characters in gilding. About thirty or thirty-two average-sized sticks of ink go to the lb. The price varies from 2*s*., or less, per lb., to so much as 7*l*. per lb., there being over a dozen different grades.

Nearly all writing is done by the natives throughout this immense empire, in Japan, Corea, Tonquin and Annam, with this China ink, rubbed down on a stone ink-slab, and applied with a paint brush of sable, fox, rabbit, &c., hair, set in a bamboo holder, and when not in use carefully covered with a protecting brass cap.

The superior kinds of this ink appear to be used in China and not exported.

### TAXATION OF MACHINERY.

IN reply to a memorial from the Association of Chambers of Commerce in reference to the present state of the law as to allowances made in income-tax assessments for depreciation of machinery and for obsolete machinery, the Chancellor of the Exchequer has directed the following letter to be written:—

"The chief points raised in the memorial are as follows:—(1) That the allowances in respect of repairs and depreciation of machinery are insufficient, and the methods of calculating such depreciations are unsatisfactory; (2) that no allowance is made for the cost of replacing machinery which has become obsolete. As to the first point, I am to say that, as the law now stands, deductions are allowed both in respect of expenditure incurred in repairs or alterations of machinery according to an average of the three years preceding the year of assessment, and also in respect of the diminished value of machinery by reason of wear and tear during the year. The allowance of these deductions is in the hands of the district or special commissioners, as the case may be, and they have to decide in each case, as it arises, the adequacy of the deductions allowed. As to the second point, I am to say that the Board of Inland Revenue have given instructions to their surveyor at Leicester, which is particularly referred to in the memorial, that where a claim is made in respect of the introduction of more modern machinery in a factory, no objection is to be taken to the allowance, as a deduction from the assessable profits of the year, of so much of the cost of replacement as is represented by the existing value of the machinery replaced. Any excess in the cost of the new machinery over the actual present value of the old is an addition to the capital of the business, and cannot

## SOHO COWL AND VENTILATOR

(NICKLIN & MILWARD'S PATENT).

This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a House Cowl, possessing as it does great suctional power, perfectly noiseless action, and great durability, being made of steel.

The COWL has proved a perfect cure in the case of most troublesome chimneys.

### TESTIMONIALS.

"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to any one suffering from smoky chimneys."

"Forward the 10-inch cowl on order at once; we have fixed the others, and find they give every satisfaction."

"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once."

## NOW READY, PROUT'S CONTINENTAL SKETCHES

Proofs on Thick Plate Paper in Handsome Portfolio, Cloth, Gilt Lettered, Size 21 inches by 15 inches, Price 4*s*.

The work consists of 75 Plates, and was originally published at 30 Guineas. The Plates are the full size of Prout's Drawings and are an exact reproduction by the

### PERMANENT INK PHOTO PROCESS.

Mr. RUSKIN, referring to these Drawings, says:—"I have," says Mr. Ruskin, "both in my earlier books and in my lectures at Oxford, spoken of the sketches of Prout with reverence and enthusiasm."

"Prout ransacked every corner of France, Germany, the Netherlands and Italy."

"The sharpest photograph is not half so natural." "His 'On the Grand Canal, Venice,' is an Arabian enchantment, his 'Street in Nuremberg' is a German fairy tale."

"Prout drew every lovely street in Europe."

May be obtained from all Newsagents, Booksellers, Messrs. W. E. SMITH & SON'S Bookstalls, or from the

PUBLISHER, P. A. GILBERT WOOD

Office of "The Architect," 175 Strand, London, W.C.

properly be regarded as a charge upon revenue for the purposes of income-tax assessment. I am to add that similar instructions will be given to surveyors in other districts when this question arises there."

### DUBLIN MAIN DRAINAGE WORKS.

THE contractors for this weighty undertaking (Messrs. H. & J. Martin, of Grand Canal Street), who are also engaged in transforming the Leinster Hall into the new Theatre Royal, are now pushing the drainage works forward, says the *Irish Times*, with creditable despatch. Westward from O'Connell Bridge, along the northern line of quays, great progress has been made in the matter of effecting a junction with the sewer coming up from Kingsbridge. In Lower Abbey Street the excavations are being carried out vigorously, these having now reached to a point opposite the Metropolitan Savings Bank. This section is in continuation of the sewer through Lower Marlborough Street. It will be continued through Beresford Place and Amiens Street to Clontarf *via* the North Strand. This section will have its outfall in the main drainage at the junction of the northern line of quays and Lower Marlborough Street. It is understood that the work on the Clontarf section will be pushed steadily forward while the surface of the northern line of quays is repaved and rendered again fit for traffic; and it is stated that the Dublin Tramways Company mean to repave on an entirely new system the portion of the quays that are under their lines, and that the laying of these lines will be regulated in view of the possibility of their being used in the future for electric traffic. The Corporation will, it is said, co-operate with the Tramways Company in the work of improving the system of paving the quays. It may be mentioned that the contractors will not be in a position to commence cuttings on the southern side of the river until the northern side is again open for traffic.

A large number of men engaged on the drainage works, pending the opening of the cutting on the southern side of the river, are finding full employment on the Clontarf section, now in operation, and on the siding in Winetavern Street, through St. Michael's Hill, to take in the wash of the Poddle River, which empties into the Liffey a great deal of drainage that is discharged into it at a point near where it joins the Liffey. Gangs of men are at present completing the Kingsbridge section from the Kingsbridge terminus, Bow Bridge, and the field in the neighbourhood of Steevens's Hospital, and as far as Old

Kilmainham. Up to the present the time has not been fixed for the completion of the paving of the northern line of quays, and consequently the time for the opening along the southern quays cannot be definitely stated. So far as the drainage operations have gone, all the work that has been done up to the present is what is known as the brick and barrel drainage. The cuttings, generally 21 feet, have been lined with brick throughout. For carrying across the opening the discharge from the sewers running into the Liffey from the northern side special provision had to be made, and arrangements have also been made for intercepting the existing sewers and linking them into the new main drainage along the quays when that is completed and the outlet is provided at the Pigeon House Fort. The existing sewerage of the city, which will be linked into the main drains along the quays, will, it is stated, be subjected to scarcely any modification except to extend and perfect it in certain districts, and it is believed that when the main drainage offers a proper outlet, the existing system, when altered, will be a very perfect one. Over the system Messrs. H. & J. Martin have 450 men employed, and the engineer for the contractors is Mr. H. E. Williams, C.E., who personally superintends the progress of the works.

### SOCIETY OF ENGINEERS.

AT a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on Monday evening, June 14, 1897, Mr. G. Maxwell Lawford, president, in the chair, a paper was read by Professor Herbert W. Umney, Assoc.M.Inst.C.E., entitled "The Compression of Air by the Direct Action of Water."

The author, by way of introduction, referred to the importance of obtaining compressed air by the simplest possible means. In particular he called attention to the best of all methods, being the only one whereby the compression takes place isothermally. The idea, however, he observed, was not a new one. He referred to the ancient methods in use in Spain, and stated the general principle underlying the system. He then directed special attention to the plant erected by Mr. Frizell of New York, which gave an efficiency of 52 per cent. when tested. He stated that an abstract of these experiments was recorded in the proceedings of the Institution of Civil Engineers in 1880.

The author then described a plant which has recently been erected by Mr. Taylor of Montreal, giving an increased efficiency

FFICE: 175 STRAND, LONDON, W.C.

of 10 per cent. He gave in detail the method of impregnating the water with minute bubbles of air, the improvement being entirely due to this feature, and pointed out the alterations necessary, being confident of obtaining 75 per cent. of the power at command. He also gave records of the trials conducted, and has computed the various hydraulic losses in the apparatus. He summarised the advantages of adopting this principle as follows:—

1. The compression takes place isothermally.
2. The initial outlay, repairs and working expenses are less than by any other means.

3. It is suitable for adoption in the case of low waterfalls.

He claimed that these far outweighed the objections of sinking a shaft.

### METROPOLITAN STREET IMPROVEMENTS.

A LIST of the street improvements in the Metropolis, contemplated by the improvement committee during the present year, has just been presented to the London County Council. The localities of the suggested improvements are Rosemary Branch Bridge, Hackney and Shoreditch, Roehampton Street, Westminster, Albert Embankment, Lambeth, and York Road, Battersea, and Wandsworth. In the first case it is proposed to rebuild the Rosemary Branch Bridge over the Regent's Canal. The total cost of the work is estimated at 6,800/., towards which the vestries of Shoreditch and Hackney are each to be asked to contribute. The estimated net cost to the Council after deducting contributions, will, if the scheme is carried out as suggested, be 4,100/.

The proposed improvement in Roehampton Street, Westminster, is in the nature of a continuation of the thoroughfare in order to afford additional communication to the new streets proposed to be laid out by the Council on the Millbank prison site. The estimated net cost of the work, including the acquisition of property, is 5,700/.. The Vestry of St. Margaret and St. John, Westminster, have offered to contribute 500/., but the committee think this an insufficient amount, and recommend the Council only to carry out the work on the local authority agreeing to contribute one-fourth the net cost.

An improvement of considerable magnitude is suggested at the Albert Embankment, Vauxhall. The proposal is that the Council should undertake, as a county improvement, the widening of part of the Albert Embankment formerly called

High Street, Vauxhall, between Vauxhall Walk and Kennington Lane. The matter has several times been before the Council and repeated attempts have been made to secure a contribution from the local authority. This has been persistently refused, but it has been pointed out that the construction of the Albert Embankment was carried out as a county improvement, and that the present proposal is a continuation of that improvement, and that the cost should therefore be paid out of the county fund. The committee feel that there is much force in that argument and have decided to recommend the Council to carry out the work without a contribution from the local authority. The present width of the road which runs north and south, varies from about 40 to 60 feet, and it is proposed to increase this to 60 feet throughout by setting back the eastern side. The estimated net cost of the paving and other works is 3,700/., and of the property, after deducting recoupment, 30,300/., making together 34,000/.

The fourth suggested improvement is the widening of York Road, Battersea, between Falcon Road and Wandsworth Station. In July 1891 the committee brought up a report recommending the Council to undertake the widening of this road, subject to contributions being made towards the cost.

The report included nine large improvements, estimated to cost in all 2,097,625/.. net, and after discussion the Council referred it to the committee to bring up those of the nine improvements which they considered to be of the greatest urgency, with the result that the York Road widening had to stand aside for other improvements which at the time were even more urgent. Recently, however, it has become more and more apparent that the widening of York Road is a work which cannot be longer postponed without grave inconvenience, and the committee have therefore had plans prepared with a view to recommending the Council to carry out some portion of the improvement. The proposed scheme embraces the widening of the portion of York Road within the parish of Battersea commencing near Falcon Road and terminating at John Street, and the widening of the portion of York Road within the parish of Wandsworth commencing at John Street and terminating at Wandsworth Station. The total net cost of the complete scheme is estimated at 80,150/., and of that amount the local authorities are to contribute one-fourth. Nearly the whole of the property to be acquired for the improvement consists of forecourts, and the estimates of the cost have been prepared on the assumption that Parliament will grant the Council power to acquire where necessary the

forecourts only, instead of being compelled to purchase the houses as well. In fact, the committee consider the granting of this power should be a condition of the carrying out of the improvement, as otherwise the cost of the property would be prohibitive. It will accordingly be necessary for the Council to ask Parliament to exempt them from Section 92 of the Lands Clauses Consolidation Act, 1845, which provides that where the promoters of a public undertaking, acting under statute, require to take part of a house, the owner shall have the right of calling upon them to take the whole.

The estimated net cost of the four suggested improvements without deducting contributions is 126,650*l.*, and after deducting contributions 102,487*l.*; the annual charge on the rates for interest on and the repayment of debt, calculated on the net cost, is 4,270*l.*—equal to 028*d.* in the pound—and the annual charge decreases each year by 4*d.*

### LISKEARD CHURCH TOWER.

THE tower of the parish church, Liskeard, having become unsafe it was decided to erect a new structure. Plans were sought in competition and the first prize was awarded to Mr. Sansom, the second being awarded to Mr. Burke Downing. In April last the vicar, the Rev. J. Norris, and churchwardens accordingly addressed a petition to the bishop praying for a faculty for the erection of a new tower with choir vestry, in view of the "precarious and dilapidated condition" of the present tower. In reply, the chancellor (Mr. R. M. Paul) wrote the Registrar in May, and the following extract from his letter was sent to the Vicar and churchwardens:—

#### *Liskeard Church.*

"I have carefully considered the petition for a faculty, which appears to me to involve the pulling down of the existing tower and the erection of a new tower of very much greater height on apparently different lines. It is possible, of course, that demolition may be an actual necessity, but inasmuch as the existing tower is said to possess considerable historical and architectural interest, I think it might be the duty of the Court to discourage rather than sanction the destruction of the tower. I have no desire to prejudge the question, but I should wish it to be clearly understood that, even if the petition should be unopposed, the Court will require the production of the evidence of disinterested experts."

In reply, the Vicar wrote a letter dealing with the report of Mr. G. H. Fellowes Prynne, who, on being called in to inspect the tower, recommended its repair. Mr. Norris wrote:—

"1. The present tower (subject to several repairs and alterations) was built for and to a much smaller nave and of Norman architecture.

"2. The present nave is of considerable size, much larger than the original one, and is of Perpendicular style.

"3. The present tower has undergone several changes, alterations and repairs, and now contains very little of its original (Norman) architecture. The battlements and west doorway are of later date.

"4. The condition of the tower, as stated by Mr. Prynne, is exceedingly dangerous. The east side is shattered from summit to base, one vertical opening being wide enough to take one's hands. There are several smaller perpendicular rents, while the south side is vertically rent, and the louvre is such that the arch stones are falling out. The north side is literally dissolving partnership by splitting into two halves; the outer wall is bulging to a heavy extent.

"5. There are no foundations.

"Mr. Prynne's description of the roof is enough. The tower is in that condition that we have long ceased to ring the bells. There is very little more to be said beyond the fact that the tower must be rebuilt. Nothing short can or will be done by this generation."

The Vicar, having described the "repairs" suggested by Mr. Prynne, which were rejected by the committee as unsuitable and impracticable, pointed out that if such work had been carried out at a cost of 1,000*l.* or 1,200*l.*, the tower would have remained "wholly inadequate to the size of the nave and the surroundings of the church, and out of harmony with its architecture—a tower that is new without the stability of a new tower, having no substantial foundations; a tower propped up by buttresses, bolted together by iron rods, and cased in granite blocks—all this to last, as Mr. Prynne said, 'many generations,' 'for many years to come.' On the other hand, the committee are prepared to erect a substantial tower, and with it a choir vestry, to cost much over 3,000*l.*; to reuse every solid stone, window, grotesque head, doorway, so-called Norman arch and battlements. We have reduced the architect's design from 100 feet to 80 feet to meet the wishes of a few and reduce the cost. We are prepared to carry out the unanimous decision of every vestry meeting. We are prepared to complete the undertaking of previous churchmen, who erected the nave, by build-

ing the tower thereof, and by completing the beautiful symmetry of the interior of the church.—J. NORRIS, M.A., vicar."

On May 17 the Chancellor gave his decision on the petition. His letter was printed in the *Cornish Times* of May 22. He said:—"The proposed new tower appears to be totally distinct in style, design and dimensions from the existing tower, and beyond the preservation of some small details, will not hand down to posterity any general idea of what to many has been the most interesting part of Liskeard Church. Both architects (Messrs. Sedding and Prynne) admit that the tower is in a very dilapidated state and that it must be taken down, and if the committee could see their way to re-erecting the present tower and submitting fresh plans, I should raise no further difficulty."

Mr. Paul's letter was considered by the tower committee on May 21, and a resolution was adopted:—"That inasmuch as no notice of opposition has been given to the petition, it is the opinion of this meeting that the Chancellor should be asked to forward the faculty at once, if a faculty is necessary."

The next letter was another from the Chancellor to Mr. Burch, dated the Monday following:—

"Truro: May 24, 1897.

"My dear Sir,—I yesterday received two copies of the *Cornish Times* (a newspaper published at Liskeard), containing an account of a meeting of the committee appointed to arrange for the erection of a new tower and some editorial remarks, of which, whilst the matter is *sub judice*, I can of course take no notice.

"From the resolution passed at the meeting the members of the committee seem not to be aware that unopposed petitions for faculties are frequently heard in open court (as will be seen from the reported cases in various Consistory Courts), and also frequently dismissed.

"If the petitioners decline to adopt the suggestion contained in my letter to you of the 17th inst. (which suggestion accords to a very large extent with the views of Mr. Sedding and Mr. Prynne), or to incur the expense of a report by an independent architect of my nomination, I have no more to say. I can, however, only repeat that I should be willing to grant a faculty to take down the present tower, and (to quote the words of Mr. Sedding from his report to the restoration committee) to rebuild, 'carefully preserving and marking the old materials, as Mr. Pearson is now doing at Peterborough, so

that the present tower may be re-erected as far as it can be done, any new walling stone being in harmony with the old.'

"I think that I may even go further and say that without insisting upon an exact reproduction of the existing tower, the Court would be justified in granting a faculty even if the height of the rebuilt tower were somewhat increased, provided there is no unnecessary departure from the general style and design of such existing tower.

"If, however, the committee will not adopt any of my suggestions, I must refuse a faculty for the erection of a tower totally dissimilar to the present one in its style and proportion.

"I am, yours very truly, ROBERT M. PAUL.

"Arthur Burch, Esq., Diocesan Registry, Exeter."

The above letter "crossed" with the following communication from the Vicar of Liskeard:—

"The Vicarage, Liskeard: May 22, 1897.

"Dear Sir,—In reply to the Chancellor's letter of the 17th inst., I beg to submit to him, through you, a copy of a resolution unanimously passed at a meeting of the tower committee on May 21. I may point out that the chosen design for the new tower was highly recommended by Mr. Sedding, and was the chosen set out of twenty-five competitive exhibits. Mr. Sedding was a perfect stranger to each and all of us. The chosen plans cost us 50*l.* (first prize), and in addition we have paid 25*l.* to Mr. Burke, of London, the winner of the second prize.

"Mr. Sansom (the winner of the first prize), our chosen architect, who was with Mr. Coad, of London (who wisely carried out the restoration of the nave), is a man of great experience and an expert. Mr. Sansom alone carried out the restoration of the chancel of this ancient church. These chosen plans cost Mr. Sansom many years of patient study and progress. The successful plans have been approved of by the parishioners and by several architects, as they were, with the other twenty-four sets, exhibited to the public for many days. They are in perfect harmony, save the interworking in of every portion of this Norman or semi-Norman tower. As Mr. Sansom is strongly conservative in his profession, he was careful to incorporate every portion of interest of the old tower into the designs for the new tower; in fact, such were our instructions to all the architects.

"No other tower but the proposed one could be in keeping with the architecture and dimensions of the nave. The present tower belonged to a much smaller and lower church; the traces of the roof of the former nave are to be seen.

Vol. LVI. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered, Price 12s. 6d. Office—175 Strand, London, W.C.

"From the evidence, and on the recommendation of Messrs. Sedding and Prynne, we have for many months past ceased to have the bells rung, much to the regret of many. The tower is truly in a very dangerous condition, and we, the Vicar and churchwardens, recognise our responsibility, and, therefore, wish to carry out—and at once—the erection of the tower from the plans of Mr. Sansom. This tower is to be in commemoration of the sixty years' glorious reign of our good Queen, as decided on in public meeting.

"I may say, in order that the Chancellor may fully understand our settled intentions—which I convey on my own responsibility, knowing the positive decision of each and all of the committees—that on no ground will we re-erect the existing tower, nor will we pay the cost of any further engagement of expert or experts. We will give a hearty welcome to the Chancellor of Truro should he honour us by personally examining the interior of this tower. We shall carry out the wishes and terms of Miss Pedler and her will.

"Ninety-nine per cent. of the population of this town is with us in the carrying out of our proposed plans. We trust the Chancellor will kindly withdraw his terms and grant to us speedily the prayed-for faculty. Every vestige of the present—every sound stone of this tower—will be incorporated into the new tower.—Faithfully yours,

"Arthur Burch, Esq., Exeter."

On receipt of the copy of the Chancellor's letter of the 24th, the Vicar further wrote the Registrar:—

"The Vicarage, Liskeard: May 26, 1897.

"Dear Sir,—I wired Chancellor Paul this morning, 'Conversation here or at Truro might facilitate business.' This I was led to after reading the copy of his letter to you. I am sending to him a photo of the church I have had in my possession some time, by which he will be better able to judge of the church and its architecture.

"It is our wish to complete the church by the erection of a tower worthy of it in appearance, internally and externally. Internally, the appearance will be in keeping, symmetrical from every point of view. Now the west end of the church (internally) has a broken, dark and unfinished look.

"The Chancellor will remember that Miss Pedler left 1,000*l.*, conditionally, towards the erection of a new tower—(1) that we must raise 2,000*l.* by 1900; and (2) that the tower cost not less than 3,000*l.* We can raise the 2,000*l.*, but could not raise 250*l.* towards rebuilding this tower. We are not

called upon to build or rebuild any tower by 1900, or by 2900, to claim the 1,000*l.*, but we are called upon to raise 2,000*l.* or commence the erection of the tower by 1900—the first we can do. We could not spend 3,000*l.* on the re-erection of this tower. I would almost venture to undertake to do this work for 1,000*l.*

"If we have to give our time and our money we naturally think that our wishes should be respected. We are on the spot and know our wishes and the wishes of the people. Our architect has plainly told us that he will not pull down and rebuild this tower. In fact, no architect would be required to do such absurd work.

"I again can only ask the Chancellor to pay us a visit and see the tower and nave; failing that, I am willing and ready to proceed to Truro to talk over matters with him.

"None of us will hand down to posterity the fact of having in 1897-98 rebuilt a Norman or semi-Norman tower of this size to a Perpendicular nave. We will incorporate the 1627 doorway, Norman windows, &c., and reuse every available stone, but there are hundreds of loads of small rubble stones which can never go into a new tower—they are worthless. You would require the angels to number them.—Faithfully yours,

"Arthur Burch, Esq., Exeter."

"J. NORRIS."

"Helena Villa, Princetown, Devon: June 1, 1897.

"My dear Sir,—I have carefully considered the Vicar's letters to you of the 24th and 26th inst., and am much obliged to him for sending me a photograph of the tower. Having seen the tower itself within the last six months, I feel that nothing would be gained by a personal interview, unless I were accompanied by an independent architect of my own selection, whose expenses would have to be borne by the petitioners.

"I was not aware, until I saw the Vicar's last letter, that Miss Pedler's legacy was conditional on the new tower costing 3,000*l.*, nor should I allow the source from which such sum is to be derived to influence my decision.

"The evidence already submitted to me consists of the reports obtained by the petitioners from two well-known architects, and these point to the necessity of taking down the existing tower and the desirability of rebuilding it, as far as possible, on the original lines. Without such further evidence as I have suggested I see no reason for varying my previously expressed opinion, and must therefore decline to grant a faculty.—I am, yours very truly,

"Arthur Burch, Esq."

"ROBERT M. PAUL."

# LIGHTNING CONDUCTORS

IN

PATENT COPPER ROPE OR TAPE.

## NEWALL'S CONDUCTORS

Are the most reliable, most effective, and cheapest offered to the public.

Sole Manufacturers of Vyle's Patent (Easily Tested) Lightning Conductors.

STEAM SAWING, PLANING, AND MOULDING MILLS.

Joinery and Fittings have been manufactured at these Works (which are the largest in the South of England) for some of the most important buildings in this Country and Abroad.

"Liskeard: June 4, 1897.

"Sir,—We have a tower committee meeting on Tuesday. If not asking too much, might I ask what do you object to in our new tower plans? If the pinnacles and west window were removed and the height of the tower reduced, there would not be much difference between the old and new towers. In the new tower the same doorway, the Norman windows, grotesque heads, arch, &c., are shown. We have chosen the lower tower of the two designs sent us by our architect. I write this on my own account that I may be better able to put before the meeting your objections. To remove the west window would be to rob the new tower and the nave of the church (internally) of their chief attractions.—Faithfully yours,

"Chancellor Paul.

"J. NORRIS."

"Helena Villa, Princetown: June 7, 1897.

"My dear Sir,—In the face of the comments in the *Cornish Times* whilst the matter was *sub judice* and your statement that 'on no account will the committee re-erect the tower, nor pay the cost of any further engagement of expert or experts,' I scarcely think that I can, consistently with the dignity of the Court over which I preside, add anything to what I have already written.—Yours faithfully,

"The Rev. J. Norris.

"ROBERT M. PAUL."

At the meeting of the committee Mr. White inquired what position the Vicar and churchwardens would be placed in provided they pulled down the present tower without a faculty.

The Vicar said that was a very hard question to answer, and although he had consulted lawyers and legal works, he could obtain no definite information on the point. Some people rather favoured the idea that they need not trouble their heads about a faculty. His own opinion was pretty well known. He should pull down the present tower without the slightest hesitation and run all risks. They could only send him down to Bodmin for a few days. But really he was not afraid of anything very serious happening if they did take the matter into their own hands.

Mr. Olver, as one thoroughly acquainted with the affairs of Liskeard Church, said he had never heard before of a faculty being deemed necessary.

Mr. Childs said he was sorry a faculty was ever asked for at all. However, he held a very strong view as to what was their legal position. If the Chancellor was going to do what he thought he could do, they might as well stop collecting money

for the purpose of rebuilding the tower, because, under those circumstances, the 1,000*l.* legacy would go to the cathedral at Truro—they could not spend 3,000*l.* on re-erecting the present tower.

After a protracted discussion, it was decided to adjourn the consideration of the subject until June 24, when a report will be submitted by the Vicar and churchwardens.

## PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

### APPLICATIONS FOR PATENTS.

13354. Henry McLauchlan, for "Stop cock and cleansing pipe combined."

13361. Walter John Brayshaw, for "Window or sash fastener."

13367. John Ritchie Hunter, for "Improvements in the construction of shop fronts."

13375. Thomas Bird Smith, for "An improvement in brick-making machines."

13396. Howard Herbert Deacon, for "A new or improved sash fastener."

13411. Mary Proctor, for "Improvements in or appertaining to venetian blinds."

13432. Sydney Warning Lockhart, for "Improvements in locks or fastening devices."

13452. Robert Thomas Harrison, for "A novel or improved device for securing window sashes."

13487. Robert Hodges Bishop, for "Improvements in the manufacture of cornice-pole brackets."

13493. Frank Bradley Thorpe, for "Waste-water preventers for flushing closets."

13560. John Thomas Abell, for "Improvements in roof glazing."

To INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

# THE NEW EXPANDED METAL

Meshes from  $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to  $\frac{3}{16}$ th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

**THE EXPANDED METAL COMPANY, LTD.,**

UNEQUALLED FOR ALL DECORATIVE PURPOSES.

**Aspinall's**

**ENAMEL**

For Inside and Outside Work.

**READY FOR USE.**

This Enamel, which has taken the Highest Award wherever exhibited, imparts a rich glossy appearance to all surfaces to which it is applied, and dries with a hard impervious surface as washable as porcelain. It is admirably adapted for use in Hospitals, Public Institutions, Mansions, Private Houses, &c., where sanitary conditions are of the first importance. One gallon will cover about seventy square yards on a non-porous surface, and is equal to about three gallons of mixed paint.

**ASPINALL'S ENAMEL** can be made to any tint, is absolutely non-poisonous, and is unequalled for *all* decorative purposes.

Builders and Decorators should apply for full particulars of our special  
 "DECORATOR'S" ENAMEL.

**ASPINALL'S ENAMEL. LTD., NEW CROSS, LONDON, S.E.**

## COMPETITION DECIDED.

GORLESTON-ON-SEA.—In a recent limited competition the design of Messrs. George I. Skipper, F.R.I.B.A., and F. W. Skipper, architects, of Norwich, was selected for a new hotel to be erected on a magnificent site on the top of the cliffs, commanding unique views of the harbour mouth, the jetty to the east and the coast line towards the south. Beneath the cliffs are excellent sites for shops, baths, lavatories, &c. Some of the shops are now being erected by Mr. I. F. W. Bray, contractor, of Great Yarmouth, who has undertaken to complete his contract by the middle of July, ready for occupation this season. The hotel is to be completed in readiness for next season.

A NEW Congregational church in Woodsley Road, Leeds, was opened on the 17th inst.

## BUILDING AND BUILDERS.

THE memorial-stones of a Baptist chapel in Tump Road, Blackheath, Birmingham, were laid on the 22nd inst. The chapel when built will accommodate 500 persons, and the cost will be about 1,200*l*.

ON the 20th inst. the sudden death took place at Isycoed, near Wrexham, of Mr. John Shone, a well-known builder in the neighbourhood. He was paying a visit to his brother, who lives close by, and whilst talking to him fell down dead. He leaves a widow and six children.

THE death has occurred, at the comparatively early age of forty-two, of Mr. Arthur James Chivers, of Cheap Street, Reading. The deceased had been in business as a builder for about twenty years.

THE foundation-stone was laid recently of a new chancel and vestry to the parish church, Stockingford, near Nuneaton.

## VARIETIES.

ALMSHOUSES for aged couples, in connection with the Grimsby Alms-houses Trust, were formally opened on the 17th inst., and the inmates given possession. The houses have been built on land given by Mr. Grant Thorold at a cost of about 70*l*. each. A number of others have previously been erected, while six more are being built for widows with families. A large number of friends were present at the ceremony, and several others sent bags of coal, tea, sugar, bread, &c. A tea and public meeting were afterwards held at the Harbour of Refuge.

LADY BROOKE, of Norton Priory, has promised to give a new reredos to Halton Church, near Runcorn.

As a memorial of her late husband, the Hon. James Byng, the Hon. Mrs. Byng has contributed £1,000 towards the cost of building a tower to St. John's Church, Tunbridge Wells.

A DISASTROUS conflagration has occurred at the Star paper mills, Finis-cowles, near Blackburn. The damage can hardly be estimated, but it is thought to be over 50,000*l*.

A PAINTER, named William Chambers, while engaged in Jubilee decoration work at Leeds, was killed by the snapping of a ladder, which caused him to drop 40 feet.

A MEMORIAL-TABLET was on the 21st inst. unveiled at Blantyre village, where David Livingstone, the African

147 STRAND, LONDON, W.C.

missionary and explorer, was born, to whose memory it was erected in the gable of the tenement which was Livingstone's home.

A BRASS eagle lectern has been presented to St. James's Church, Doncaster, in memory of the late Rev. J. Campion, who was vicar of St. James's from 1853 to 1890. It is a Jubilee gift from parishioners and members of the congregation.

At the parish church, Stranton, West Hartlepool, on Sunday, a memorial window, erected by the officers of the 4th D.A.V. in memory of their late commander, Colonel Cameron, was unveiled by the vicar (the Rev. J. Bennett) and the Rev. D. A. Stewart.

THE new non-infectious hospital at Rothesay, which has been built at a cost of 3,000*l.* from voluntary contributions, and named the Victoria Cottage Hospital, in commemoration of the Diamond Jubilee, was formally opened on the 21st inst. by the Marquis of Bute.

LORD EBURY'S mansion at Moor Park, near Rickmansworth, was partially destroyed by fire on the 18th inst. The house hose was brought into requisition, and, shortly after the arrival of the Rickmansworth and Watford Brigades, the fire was got under control. An upper storey room was considerably burnt, but the damage is not so extensive as was at first reported. The origin of the outbreak is unknown.

MESSRS. GEORGE I. & F. W. SKIPPER, architects, of Norwich, have received instructions to prepare designs for the new town hall and public library, &c., proposed to be erected in East Dereham, Norfolk.

At the Sheringham Hotel, Norfolk, a new central block and corridor connections, comprising large dining-hall, kitchen, sitting-rooms and thirty-five new bedrooms, with all modern appointments, are now being completed by Mr. George Riches, contractor, of Cromer. The whole of the building, including the decorations internally, has been carried out from the designs of the architects, Messrs. George I. & F. W. Skipper, of Norwich. The hotel by these additions becomes the largest in East Anglia.

THE first sod of the new waterworks at Midhope for the Barnsley Corporation was cut on the 17th inst. There are now some 70,000 people dependent upon the Barnsley water supply, and under the new Act 30,000 more, who cannot obtain water elsewhere, are brought within the area of supply. The Ingbirchworth reservoir may give a maximum supply of 1,250,000 gallons per day, the new reservoir will give 1,600,000

gallons per day. It is estimated to cost 170,000*l.* to complete the works.

THE Skinners' Company has decided to contribute a hundred guineas, and the Fishmongers' Company twenty guineas, towards the purchase of Churchyard Bottom Wood, Highgate, as an open space. Promises of donations have been received to the amount of 4,916*l.*, besides 10,000*l.* promised by the Hornsey Urban District Council, and 2,000*l.* and 1,000*l.* by the parishes of Islington and St. Pancras respectively. The Middlesex County Council has agreed to contribute a sum not to exceed 5,000*l.*, and there is a prospect of obtaining support from another quarter, but a considerable amount is still required to complete the purchase and drain the wood.

THE plans for the new Congregational chapel, &c., which have just been erected in Woodsley Road, Leeds, comprise a chapel, 57 feet by 38 feet, with gallery, to seat 500 persons; a schoolroom, 55 feet by 30 feet, for 400 scholars; a large classroom, 21 feet by 19 feet; six classrooms opening out from the schoolroom; minister's vestry and requisite conveniences. Only the chapel, minister's vestry and large classroom have so far been built. The structure is in the Classic style of architecture, the walls being of pressed bricks with stone dressings. The internal woodwork is of pitch pine. The whole has been erected from the design and under the superintendence of Mr. G. F. Danby, architect, Leeds. The total cost will be about 3,300*l.*, and 2,300*l.* has been expended on the work already completed.

### STONE AND ALABASTER VASES.

THE Egyptians used different kinds of stone for making bowls, jugs and other vases destined to hold the liquids and other substances offered to the gods, or otherwise employed for religious or private purposes. The principal materials used for this purpose were granite, basalts, serpentine and alabaster, or arragonite, a kind of stalagmite of great beauty of a creamy-white colour, and more extensively employed than any other material, especially for vases of the toilet. The kind in use at the earliest period of the fifth and sixth dynasties was plain and of one uniform layer, but about the twenty-fifth dynasty a zoned arragonite of yellow colour and many layers came into use. The principal shapes are a hemispherical vase with wide

open mouth for holding wine, basins, cylindrical vases with wide rims for holding unguents or oils, an elongated vase with pointed foot, also for holding unguents or perfumes; a vase with cylindrical body, large flat lips and mouth, often employed for holding cosmetics; and vases in shape of the wine-jugs, the Greek olpe or the oinochoe, the two-handled amphora and drop-shaped alabastros, and other shapes. On many of these alabaster vases the name of the monarch in whose reign they were made, of the person in whose tomb they were deposited, and even the amount of the capacity, or their dedication for sepulchral use is incised in hieroglyphs. The alabaster vases appear to have been highly prized. They had covers of the same material, and were used only for domestic purposes by the upper classes. So much were they esteemed that they were exported from Egypt, and the names of Persian monarchs have been found in hieroglyphs and cuneiform characters upon them, while vases apparently in Egyptian material, if not of Egyptian fabric, have been discovered in the early tombs of Asia Minor, Greece and the isles of the Archipelago.

### DESIGN AND PRACTICE IN BUILDING.

THE completeness of the image presented by his first conception is no bad measure of the imaginative capability of any architect, and it is the gift of that capability of seeing the invisible in a tangible and definite form—one which while being both sublime and beautiful shall be so practical as to admit of realisation—which really constitutes the highest measure of architectural genius. Genius in practice is but of little value as creative genius if it be not accompanied by that physical energy, strength and perseverance which convert the phantasy of the imagination into the practical reality of the mind. Thus men who possess this rare combination of power to imagine and power to realise have never in history failed to exhibit those persistent efforts to acquire knowledge by which alone they are enabled to command utilitarian resources and make possible what weaker minds might consider to be impracticable. They in fact exhibit the true mastery of mind over matter, they are the "makers" of the Greek, and best exercise that very power of directing the artistic labours of others to a successful issue which the Vitruvian definition gives us as the leading function of the architect.

### ROYAL AGRICULTURAL SOCIETY.

THE Manchester meeting of the Royal Agricultural Society, which opened on Wednesday last, is one of the largest and generally most satisfactory which has been held since the memorable Windsor show in 1889. The third section, in which only we can take any professional interest, as that is the machinery and engineering section, is more than up to the mark of previous years. Among the largest exhibitors in this section are Messrs. Newton, Chambers & Co., Limited, who, at Stand No. 148, Machinery in Motion, are exhibiting, as usual, a good number of their patent and improved cooking ranges, which have a very high merit, and are worthy of inspection. This firm manufacture almost every conceivable article in cast-iron, such as the following, from which their various exhibits are taken:—Altar rails, ash bins, ashes' grates, air bricks, baker's ovens, balconies, bannisters, bar weights, boilers, wrought and cast-iron; boundary posts, brackets, carving tables, castings generally, cattle troughs, cisterns, coil boxes, coil cases, coil pipes, columns, communion rails, condensers, cooking apparatus, corn bins, crestings, dampers, dust hoppers, expansion joints, fountains, garden bordering, garden chairs, garden seats, garden rollers, gasholders, gas mains, gas valves, gates, gill pipes and fittings, girders, gratings, gullies, gutters, heating apparatus, hot hearths, hot-water pipes and fittings, kitchen ranges, lamps, laundry stoves, lifting gears, mangers, manhole frames and covers, mantel registers, manure pumps, palisading, park seats, pig troughs, pumps, purifiers, radiators, railings, rain-water pipes and fittings, retorts, scrubbers, seat standards, sham registers, soil-pipes and fittings, stable fittings, staircases, steam closets, stench traps, stop-tap boxes, stove pipes, stoves, cast-iron tanks, tomb fencing, valves, vases, verandahs, ventilators, ventilating grating, water grates, water pipes, windows.

Their latest production is the Colvent and Fervent Radiators, the cheapness, utility and durability of which cannot be excelled. This firm manufacture many other kinds of radiators, specimens of which may be inspected at their stand. The Kingston, Octopus, Newton, Olympian and the Finsbury are among their wrought welded boilers, and are specially commended; as is also their cast-iron Mornington

boiler, the latter especially being suitable for amateur gardeners; the different designs of garden vases are such as to rank them amongst the first of this class of goods. It need hardly be said that garden rollers, hot-water pipes and fittings, sanitary castings, lamp posts, staircases, tank plates, retort mouthpieces and many other miscellaneous goods too numerous to mention, are amongst this firm's manufactures. Last but not least is their exhibit of the current steam portable disinfecter, of which large quantities have been sold to the principal public institutions throughout the country. The entire arrangements of this firm's exhibits at the show are in the hands of Mr. C. W. Dawson, eldest son of Mr. Geo. Dawson, J.P., C.C., managing director of Messrs. Newton Chambers & Co., Limited, Thorncliffe Iron Works, near Sheffield.

The "Trusty" Engine Works, Cheltenham, have, too, an attractive show of their well-known "Trusty" oil and gas engines, showing amongst others  $3\frac{1}{2}$ ,  $9\frac{1}{2}$  and 25 horse-power fixed, and  $9\frac{1}{2}$  and  $12\frac{1}{2}$  horse-power improved portable oil engines, and 1 and 10 nominal horse-power gas engine, and an excellently-arranged electric installation (by Drake & Gorham, London), driven by one of the larger engines.

This company inform us that during the last twelve months they have supplied a large number of their engines for such installations both at home and abroad, and at the present time several important contracts are in hand for lighting country houses. The use of these engines (which are now largely manufactured in all sizes, single cylinder, from  $\frac{1}{2}$  to 40 horse-power) for general farm and estate purposes are now so well known that farmers and others are having the fullest confidence in replacing their steam-engines, horse-gears and turbines by them. Since the last royal show some important contracts have been completed for the South American, Japanese and Norwegian Governments, and the leading home and foreign railways, and at this moment a large pumping contract is being put down for one of the leading railway companies.

### THE PALACE OF BLENHEIM.

SIR UVEDALE PRICE, whose work on the picturesque will never be forgotten, stood before Blenheim with Reynolds's eulogy of the architect in his recollection, and looking at the vast extent of front, the massy columns, the grand porticoes, the lofty towers, the innumerable pinnacles and

clustered chimneys, which gave light and shade and such varied magnificence to the elevations and the horizontal profiles, concurred with the painter, and then endeavoured to discover on what principles the whole had been planned. "Reynolds is the first," he says, "who has done justice to the architecture of Vanbrugh by showing that it was not a mere fantastic style without any other object than that of singularity, but that he worked upon the principles of painting, and that he has produced the most painter-like effects. It appears to me that at Blenheim Vanbrugh conceived and executed a very bold and difficult design, that of uniting in one building the beauty and magnificence of the Grecian architecture, the picturesqueness of the Gothic and the massive grandeur of a castle, and that in spite of many faults, for which he was very justly reproached, he has formed, in a style truly his own and a well-combined whole, a mansion worthy of a great prince and a warrior. His first point appears to have been massiveness as the foundation of grandeur; then, to prevent the mass from being a lump, he has made various bold projections of various heights as foregrounds to the main building; and, lastly, having been forcibly struck with the variety of outline against the sky in many Gothic and other ancient buildings, he has raised on the top of that part where the slanting roof begins in any house of the Italian style a number of decorations of various characters. These, if not new in themselves, have at least been applied by him in a new and peculiar manner, and the union of them gives a surprising splendour and magnificence as well as variety to the summit of that princely edifice." The genius of Vanbrugh as an architect since the diffusion of these and other equally generous criticisms has been sufficiently acknowledged. The originality which ruined his fortune has raised his fame, and he now stands, as he deserves, high on the vantage ground of original invention—a position in which there are few British rivals to jostle him. He has many faults, among which all must recognise a cumbrous splendour, a multiplicity of little parts in buildings of diminutive size, and a want of attention to interior detail; but the merit of an originality at once grand and poetic atones for all such deficiencies, and places him foremost amidst the architects of our latter times. He will ever be honoured as the only great original architect of the reign of Queen Anne and George I., and his last comedy, "The Journey to London," will satisfy all the world that, however the bad taste of his age may have poisoned his theatrical vein, he might, under other circumstances, have been a dramatic classic at once refined in art and blameless in morals.

## ART AT WARING'S.

THE beautiful and artistic catalogue which Messrs. Waring have issued as descriptive of their very interesting exhibition of antique furniture, tapestries, embroideries, brocades, &c., chiefly Spanish and Italian, although by no means entirely from those sources of ancient *objets d'art*, should be regarded as a valued acquisition by every connoisseur in such matters. Admirably printed on old English paper, with vellum cover ornamented with the royal arms embossed in red, the volume is extremely attractive in its get up; but its interest lies in its admirable illustrations of the principal objects exhibited, which embrace historical velvets, hangings, tapestries and embroideries, comprising ecclesiastical and other vestments, including an historic elaborately-worked Byzantine chasuble said to have been worn by Charlemagne. There are numerous sketches of antique silver in exquisite designs, curious quaint old furniture, including a Shakespeare chair from Ann Hathaway's cottage. A fine old carved oak Elizabethan bedstead, with inlaid frieze panels, arches, columns, &c. Choice family furniture of the periods of Louis XIV., XV., XVI. and XVII., and the Empire, and a fine old oak room from the house of Rubens at Antwerp, which is an interesting Flemish panelled oak room, with frieze inlaid with ebony panels and carved with heads, and a fine chimney-piece with panelled frieze and terminal figures and double-fluted pilasters. The pair of folding doors, the lower panels of which are carved with figures of St. Peter and St. Paul, have open fluted columns, capitals, &c. The smaller doorway has an over door, with finely carved terminal figures and busts. The stained-glass wrought-iron grilles in the windows, the brass chandelier, wall-lights and brass log vases, and the interesting examples of furniture of the period, render complete this example of a room of the seventeenth century.

## CITY OF LONDON LUNATIC ASYLUM.

THE Corporation of London has recently considered the advisability of carrying out many improvements at the City of London Lunatic Asylum at Stone, near Dartford, consequent on a report of the Commissioners in Lunacy in April 1896, in which they express a hope that an early commencement will be made in the extension of the infirmaries, the building of a detached chapel, laundry, &c.

It was not till 1864 that the City of London possessed a

lunatic asylum of its own; now the management of the Asylum has received such high praise that the authorities of various unions and parishes send patients, and so large has been the demand for accommodation for private patients that owing to want of space many such patients have been refused.

It was in April 1857 that the Court of Common Council considered the question of carrying into execution the Lunatic Asylums Act of 1853, and thus provide a lunatic asylum for the City of London.

The result of deliberations of the special committee appointed was the expression of opinion that a pauper lunatic asylum was a necessity, and that patients in such an institution would be under a more perfect system of classification and discipline than was compatible with the accommodation provided in the unions and various licensed houses then in use.

In 1864 the land was purchased and the building erected at an expenditure of 68,105*l.*; from time to time it was found necessary to add to the building. In 1874 the female wing was enlarged at an expense of 9,000*l.*; in 1878 the detached cottage hospital was built, this costing 2,850*l.*; seven years after the male wing was enlarged, 5,100*l.* being expended; two years later an expenditure of 8,000*l.* was incurred by the purchase of Stone Lodge Farm, having 107 acres of land.

The necessities of the institution having grown, it is now contemplated making various improvements at an estimated cost of about 46,770*l.* These improvements consist in providing a new laundry, to be built in three sections, which will provide for the washing of 11,000 articles weekly, and this it is estimated will cost 16,225*l.*; the female hospital will consist of three dormitories, eight single rooms, &c., and for this 11,400*l.* is to be set aside; the male hospital will provide a dormitory for fourteen patients, six single rooms, at an expense of 4,900*l.*; bath-rooms will necessitate an expenditure of 3,075*l.*; water-closet accommodation, 2,250*l.* The large outlay of 8,700*l.* for a recreation-room, in which quiet and well-behaved patients of either sex can meet at a theatrical performance, concert and weekly dance, is an instance of the kindly treatment of lunatic patients. This sum will include the building of a detached chapel.

A new clock turret, to be erected at a cost of 220*l.*, completes the outlay suggested of 46,770*l.*

It will be seen from these figures that the City of London is determined to do its duty in this respect, and few, if any, will complain of the county rate by which it is proposed to raise the necessary funds.

# EWART'S COPPER "CROWN" VENTILATOR

FACTORY—346, 348, 350 EUSTON RD.,  
LONDON, N.W.

**SHERNBOURNE CHURCH, SANDRINGHAM.**

At Norwich Consistory Court on the 16th inst. Mr. Chancellor Blofeld granted, on the application of Mr. J. B. T. Hales, proctor of the court, a faculty to the vicar and churchwardens of the parish of Shernbourne, near Sandringham, for the restoration of the church of that parish. This is a small flint-built structure erected in the Early English style, and is stated to have been the second church founded in East Anglia by St. Felix. Its ancient font is one of the finest examples in the county. The fabric was in a very dilapidated condition when, some few years since, the Prince of Wales purchased an estate in the neighbourhood of which the parish forms a part. One of his first acts of ownership, says the *Norfolk Daily Standard*, was to look to the condition of the little church in which the parishioners had for centuries been accustomed to worship, and it is due to this thoughtful consideration that the ancient and interesting building is about to undergo the improvement it so much needs. Plans have been prepared by Mr. H. J. Green, the diocesan architect, by which the chancel and south aisle are to be rebuilt, new roofs provided, the church reseated, and the general repairs of the fabric carried out satisfactorily. The estimated cost of this extensive restoration of a sanctuary which provides sitting accommodation for about seventy people is 1,500*l.*, and it is a fact worthy of record that the Prince of Wales, with his customary generosity, has contributed no less than 1,000*l.* to this amount—an example which many land-owners in the country might very well emulate.

**THE NEW GENERAL HOSPITAL, BIRMINGHAM.**

In view of the opening of the new General Hospital the Corporation, says the *Birmingham Post*, is pushing on the improvements at the junction of Steelhouse Lane and Corporation Street. The Council, it will be remembered, decided, in deference to a generally expressed wish, to set back the street line at this corner, chiefly to open up the view of the noble architecture of the new hospital. A piece of land, formerly covered by unsightly buildings, and having an area of 355 square yards, was given up by the committee of the improvement scheme, while the authorities of the General Hospital gave up a slightly larger portion opposite, at the corner of Steelhouse Lane and Loveday Street. The result is that Steelhouse Lane at this point, instead of being something like a gullet, is now a wide street debouching into a spacious junction at the corner of

Lancaster Street and Corporation Street. Instead of the tramway lines running close to the footpath, a wide stretch of roadway intervenes between them and the nearest line of buildings. The condemned buildings have been cleared away, and the angle made by Corporation Street and Steelhouse Lane has been rounded off and provided with a wide footway. The out-patient department of the hospital is seen in direct view from Corporation Street, and to an advantage that could never have been realised without this improvement. From the actual corner the ornate gateway, with the picturesque pile of buildings rising behind, may be seen, while from the new portion of the roadway may be obtained an oblique view of the whole frontage, with glimpses of the lower parts of the main buildings and of the statuary and other ornamental features of the courtyard. The portion of Steelhouse Lane in front of the hospital and the open square at the junction is being laid with wood blocks. The street traffic, including that to and from the hospital, will be greatly facilitated by the alteration, while the advantage of bringing so fine a piece of architecture as the new hospital into something more like the prominence it deserves cannot be overrated. The only matters for regret are that the buildings still left standing at the corner are the opposite of ornamental, and that the clearance could not have been extended so as to bring into direct view from Corporation Street the whole of the hospital frontage.

**SANITARY IMPROVEMENT IN SCOTLAND.**

THE annual congress of the Sanitary Inspectors' Association of Scotland was held on the 18th inst. in the Town Hall, Aberdeen. There were about sixty inspectors present.

Mr. Kenneth Cameron, chief sanitary inspector, Aberdeen, the president for the ensuing year, delivered his inaugural address. He said that undoubtedly much of the opposition which was given to sanitary work in its earlier stages arose from the feeling that the rights of the individual were being invaded without authority and just cause. Much of this antagonism had, however, been overcome, and the great mass of the people, speaking generally, acknowledged that the work undertaken by the sanitary officer was really for the benefit both of the individual and the general community. The work and multifarious duties of the sanitary inspector, tending as they did towards the general good of the community, must be held to be an important agency among others that had within the past thirty years steadily made towards the

**445 OXFORD STREET, LONDON, W.**

amelioration of the condition of the people. What had been done in this way might be more clearly brought into view by looking at the decrease that has been made in the death-rate throughout Scotland. Of course he did not claim that sanitary work had been alone concerned in this direction, but he made bold to say that the work of the sanitary officer had been a factor in no small measure in obtaining these gratifying results. The death-rate in Scotland during the three decades from 1866 to 1895 inclusive has been as follows:—1866 to 1875, 22·3 deaths per 1,000; 1876 to 1885, 20·0 deaths per 1,000; 1886 to 1895, 19·0 deaths per 1,000. Thus between 1866 and 1895 the death-rate in Scotland has fallen from 22·3 deaths per 1,000 to 19 deaths per 1,000, or a reduction in the number of deaths per 1,000 of population of 3·3. The estimated population of Scotland at the present time was about 4,200,000, and thus the annual saving of life is not less than 13,860 persons. The reduction in the death-rate of the eight principal towns in Scotland during the same period was still more remarkable, as the following figures show:—From 1866 to 1875 the death-rate was 26·5 per 1,000; 1876 to 1885, 22·5; 1886 to 1895, 20·8. The decrease between 1866 and 1895 in the case of the towns was thus 5·7 per 1,000 of population. The estimated population in these eight towns at present was about 1,350,000, so that the saving of life in these centres of population was above 8,800 persons per annum. To have any share in effecting such great results was to raise the work of the sanitary inspector into a sphere of importance which many of them were sometimes inclined to overlook. While trusting that legislation would help them, as it had done in the past, the best guarantee we have for the future of their profession and for the measure of its usefulness was that of an enlightened and educated community, who would acknowledge more and more that the duties which the sanitary inspector sought to perform were not for the benefit of the individual only, but had as their highest aim the permanent good of the whole people.

Mr. Wm. Mackenzie, county sanitary inspector, Ross and Cromarty, gave interesting particulars as to the sanitary conditions existing in the Outer Hebrides, especially the state of matters as they exist in the Island of Lewis. The people at bottom were, he said, extremely conservative, living in a traditional past, and refusing to recognise that the times in which they lived were moving on, and looking upon everything modern with suspicion, and as an innovation to be abhorred. The Local Authority and County Council were both thoroughly

alive to the wretched state of matters, and were doing what they could to improve them, but they felt almost powerless, and he dreaded to think what the end might be unless special means were devised by Government, as in the case of the schools, or by way of a grant or loan, to enable people to erect suitable premises and otherwise improve their holdings. There was a hope at present that the Congested Districts Board about to be appointed might be given sufficient power to grapple with the circumstances. Mr. Mackenzie suggested that the Association might consider the advisability of petitioning Parliament with the view of having the condition of matters he had described improved.

At a later stage of the proceedings the following resolution was unanimously passed:—"That this conference of the Sanitary Inspectors' Association of Scotland, believing that the housing of the people in the Outer Hebrides and western islands is of the very worst description and detrimental to their health, respectfully bring the subject before the Secretary for Scotland in the hope that further investigation will lead to adequate assistance being provided by Government on their behalf, without which we believe their condition cannot be materially improved nor the problem solved."

### INDUSTRIAL DESIGN IN GERMANY.

GERMANY appears to have made very rapid progress in recent years in pattern-drawing and designing. France has long held the first place in these particular branches, but Germany's rapid strides of late years bid fair to make her, in the near future, a most formidable rival of France in designing and pattern-drawing for textile fabrics. The United States Consul at Glauchau says, in his last report, that thirty years ago designers or pattern-sketchers were almost unknown in the German Empire. Since then, branching out from the German technical schools, pattern-drawing has been pursued with most satisfactory results to the present day. Of late years the rush of young men to this branch of art designing and pattern-drawing as a profession has extraordinarily increased. In the Royal Industrial Art School at Plauen in Vogtland, which city is the centre of the embroidery and curtain industry, about 200 young apprentices in designing annually finish their course. There are other large schools established in various parts of Germany, the principal ones being situated at Dresden, Berlin

and Crefeld. Three ways are open to every young man desiring to attain an education in pattern-drawing and designing. He can either bind himself for a certain length of time as apprentice to an independent designer, who sells his pupils' sketches at discretion to manufacturers, or he enters the workshop of a manufacturer, who places the apprentice in charge of one of his draughtsmen until the apprentice becomes a qualified designer, when he gains promotion according to his own ability and originality of ideas; and lastly, a young applicant having means may attend one of the academies of fine arts established by the State, where the highest proficiency is to be attained. Here pupils are thoroughly qualified according to the methods of the best teachers, whose instructions are most effectively and systematically carried out. Of late various municipalities have also spent large sums of money in establishing schools for pattern-drawing. At the Academy of Fine Arts in Barmen, a department for the education of designers is about to be established by the State, and a prominent expert designer from Saxony, well skilled in the education of draughtsmen for the textile trade, has been especially engaged as principal teacher of the school. Schools which are modern, and which offer collections always accessible to apprentices and young designers, and keeping pace with the demands of art at the present time, are much appreciated in Germany. It was principally the schools, collections and State workshops which Colbert established in the seventeenth century in France, and which are now distributed all over the country and abundantly sustained, that have brought the French textile industry up to its present standard of excellence. Pattern-drawings from the Lyons Academy of Design, in their superior and artistic idea of the language of forms and flower designing, have taken first place among all designs, and have, by their beauty of conception and originality, largely influenced everywhere pattern-designing for textiles and designs for decorating.

#### STREET IMPROVEMENTS IN LEEDS.

AN inquiry was held in Leeds by Colonel Hasted, R.E., inspector of the Local Government Board, relating to the application of the Leeds Corporation for permission to borrow 62,300*l.* for the purpose of carrying out street improvements in the city.

The town clerk, Mr. Harrison, said that according to the last published statement of the finances of the borough the

assets were 6,177,077*l.*, which amount included valuable properties, such as the tramways, the waterworks and the gas undertaking. The estimated debts were 4,568,093*l.* Since these figures were published the Corporation had floated a loan for 500,000*l.*, which bore interest at the rate of 2½ per cent. The money was forthcoming without any difficulty, and had not yet been used. It was not included in the figures previously mentioned. The general district rate of the city for the current year was 5*s.* 10*d.* in the pound, and of this amount 9*d.* was for highway purposes. The application of the Corporation now was that the repayment of the loan of 62,300*l.* should extend over a period of thirty years. The works at present contemplated included the repairing of a large number of streets with granite and concrete. This work had been rendered necessary in many cases by the installation of the electric tramway system, and also by the wretched state of the tramways when taken over by the Corporation. A large number of other streets were also included in the works projected; indeed, Leeds was to a large extent being repaved. Since the scheme was adopted an alteration had been made by the decision of the committee to lay down, at a somewhat increased expenditure, wood paving in Park Row, instead of granite. In 1884 permanent public works were undertaken on loan, the principle being followed that the cost of the works which benefited a future generation should be spread over as long a period as was possible. That was the proposal also at present. The Corporation had power to make the highways rate as high as 2*s.* 6*d.*, and as it stood only at 9*d.*, he thought they were well within the limit in the present application. The mileage of highways in 1884 was 266 miles, and at the present time it was 320, so that in the thirteen years the Corporation had had an increase of public highways repairable by the public of 54 miles. He thought the fairness would be admitted of the proposal to spread the cost of these works over a considerable period, seeing that the works would be of great public benefit for many years to come. It was many years since Leeds Corporation made any similar application with reference to paving works, and many of the streets required repair through age. In many cases, where the tramways had been relaid, the roadway on either side was at present on a lower level than the rails, and it was absolutely necessary that such a state of affairs should be remedied. This applied to seven miles of streets, or fourteen miles of tramway track. Of course, the repairing and maintenance of the tramway track, and also a width of 18 inches on either side outside

The inspector afterwards, in company with the city officials, drove over a part of the streets proposed to be repaired.

### THE ELECTRIC LIGHTING OF PORTOBELLO, EDINBURGH.

THE following report by Professor Kennedy, consulting electrical engineer for Edinburgh, on the subject of a supply of electric current to Portobello, has been prepared for the Corporation:—I have now been able to examine very carefully into the question of the supply of electric light to Portobello, which has been referred to me. In working out this matter I have found it to be so much mixed up with the question of a second station in Edinburgh—which no doubt, at some not very far distant time, the Corporation will have to consider—that I have found it impossible to consider it entirely by itself. Although, therefore, I have not been formally asked to make any report on the latter point, I have found it necessary to discuss it somewhat in the following remarks as to the question of supplying Portobello. I visited Portobello in order to form some estimate of the amount of electric light which it might require, or, at any rate, which might probably be asked for within its limits, in order to see what the cost of supplying any such amount of light would be to the Corporation, and how far the expenditure would be remunerative. I have come to the conclusion that it would be safe for you to assume that in the course of, at any rate, a couple of years, there will be a demand for at least the equivalent of 4,000 eight candle-power lamps in Portobello. I understand that the owners, or lessees of the pier have stated that they would become consumers, but I have had no figures as to what demand they would make.

I do not know to what extent the question of street lighting in Portobello is to be considered, but if, besides this private lighting, the line from the station to the sea were lit with arc lamps, the Promenade itself and the High Street, the lamps being placed about 70 yards apart, there would be required about 36 arc lamps in all. From whatever point in Edinburgh the current is to be supplied there is no doubt that it would have to be supplied at high pressure, for otherwise the cost of mains would be disproportionately great. Portobello would

therefore be supplied from some station in exactly the same way as the northern and southern suburbs of Edinburgh, are now supplied from Dewar Place, and by exactly similar machinery. The fact that Portobello is three or four miles away instead of being only a mile and a half practically does not make any electrical difference in the case, although it somewhat increases the proportional cost of mains. Considering only current for private lighting in the first instance, I find that the total cost of supplying and laying the necessary high-tension cables as feeders, low-tension distributing mains, with all road work, transformers and transformer sub-stations, as well as meters and connections for, say, fifty consumers, will be about 7,500*l*. This does not include any machinery of any sort, as it is certain that the supply to Portobello would have to be simply a portion of the general work of the station it was supplied from—no special machines would have to be put down in the station for the purpose of supplying Portobello and doing nothing else. The 4,000 lamps wired may each be taken as using 15 units per annum, making a total of 60,000 units sold per annum. Of course this is estimating at a very much lower figure than in Edinburgh, where, largely on account of the public lamps, each lamp used in 1896-97 as much as 26.6 units per annum. But it would not be safe to take nearly so high a figure for Portobello.

The cost of supplying this amount of electrical energy may be estimated as follows:—

	Per unit sold.
Generating expenses per unit sold, say	1.0 pence
Capital charges:—5 per cent. for interest and sinking fund on an amount of 7,500 <i>l</i> . is equivalent to	1.5 „
Maintenance and attendance in connection with the mains may be estimated at 37.5 <i>l</i> . per annum, which is also equal to	1.5 „
The value of the plant used in the station for supplying Portobello would be about 2,000 <i>l</i> ., and an allowance of 5 per cent. for interest and sinking fund on this capital would amount to	0.4 „
The total cost per unit sold in Portobello, including all capital charges, would thus be about	4.4 „

I do not think you could sell this current, delivered at so great a distance and on so small a scale, for the same price which you are charging in Edinburgh itself unless you were to sell it at a loss. But if you were to charge the current at 5*d*. per unit there is no doubt that it would contribute some share to the profitable working of the station. At 4.5*d*. per unit it

would practically be sold at cost price, which I imagine you would hardly be willing to do until experiments had shown you what the cost price actually was. The cost of the thirty-six arc lamps, with all the necessary leads, and with proportion of cost of rectifiers, assuming the leads to be arranged in two circuits, would be about 4,000/. But the same leads would be sufficient to supply from twenty to twenty-five additional lamps along the road if they should be required. The cost of supplying these lamps with current would be the same as in the case of other lamps so far as generating expenses were concerned, but somewhat greater in capital charges because of the very much greater length of leads in proportion to the number of lamps. It is difficult to say in such a case exactly what the cost would be, but it would certainly not exceed 20% per lamp per annum—possibly this might be reduced to 18%. A question which I have had, of course, to consider very carefully has been whether the current for these lamps, and for the lighting of Portobello generally, should be supplied from your present station in Dewar Place, or from some new station which in the course of time you will undoubtedly have to erect. After going very carefully into the matter, I have come definitely to the conclusion, keeping specially in view the fact that by this autumn your Dewar Place station will be changed over to double voltage, that it is very desirable to keep all the high tension work in one station, and to place in the future station solely continuous current plant. The use of the double voltage will enable you easily to supply continuous current in suitable places for distances of a mile and a half, or even two miles from the station. Although there will be in your extensions a considerable increase of the supply by alternating current, yet, at the same time, it will gradually be possible to change over the distributing mains now used for alternating current in the parts of the city nearer the station, to the continuous current system, leaving the alternating current always for the furthest out districts. I do not think, therefore, that the demand for alternating current will ever be greater in Edinburgh than you can quite easily supply from plant in a portion of your Dewar Place station, where it has been arranged to be placed, and where, in fact, similar plant now stands. It will, of course, be necessary, in reference to this question, to consider where a second station can best be placed when one has to be erected. No doubt some site can be found in the north or north-east of the city which would be considerably nearer to Portobello than Dewar Place is, and from which therefore the actual outlay in mains would be considerably less than if the supply

were from Dewar Place. But the additional cost of spare high-tension plant, which would otherwise have to be put down at any new station, of starting a new high-tension switchboard, new rectifier board and connections, &c., very considerably more than counterbalances this saving in cost, so that on the whole, assuming as necessary that Portobello has to be supplied by high-tension current, it will be cheaper to do it from Dewar Place than from any new station, unless it were necessary to have high-tension machinery at the latter in any event, which I have already stated is not, in my opinion, the case. The estimates which I have given above, therefore, are based on the assumption that the current for Portobello is supplied from your present station.

In connection with this question of a second station I think it may be interesting to you that I should lay before you some figures arrived at in connection with my working out of this matter. I find that the Dewar Place station will be sufficient to contain plant and the necessary reserves for about 180,000 lamps of eight candle-power wired, besides the arc lamps. At your present rate of progress you may reach this number in about eighteen months from now. Although, therefore, there is no need for immediate hurry in arriving at any decision as to your future course, yet it would be as well that the committee should bear in mind that before very long it will be necessary to decide on what steps are to be taken in order to meet the increase of demand. I have no doubt myself that it would be well to put down a second station. (In Glasgow, I understand, the Corporation have under consideration the question of erecting two more stations, one in the north and one in the south.) Any such second station should be situated symmetrically with the first so far as possible (*i.e.* in the north or north-east), and it must be placed upon a line of railway, so that the coal may be easily and cheaply obtained. The second station, wherever it was built, would work always in parallel with the first, the mains from the two being absolutely connected, but capable of being easily separated for purposes of testing, &c. In this way, in the case of a breakdown at either station, the other could always help it to a certain extent. For reasons, however, which I have already mentioned above I think it is unnecessary, and if unnecessary it is certainly undesirable, that the second station should have any high-tension plant in it. It would be solely a continuous current station worked at 460 volts, the whole of the high-tension plant being concentrated at Dewar Place, and distributed from there by the high-tension switchboard.

**THE MARBLE TRADE.**

It was once said by a keen observer of men, says a writer in the *Stonemason*, that the marble trade must be a peculiarly depressing business, for he had never yet come across a man with a happy face engaged in it. We are inclined to doubt this sweeping assertion, but certainly the troubles and trials in connection with this particular business are greater than those which fall to the lot of most mortals.

To begin with, the nature of the material in which he trades is a source of perpetual anxiety to the dealer. He never knows what a block will turn out until it is opened, and with regard to the white marbles especially, their clear texture shows every mark which nature has set upon them, and this creates a position full of many difficulties. There are some people who never will understand that it is nature and not the quarryman who is responsible for the marking of marble, and nature is a somewhat capricious manufacturer. She abhors sameness, and infinite variety always accompanies her handiwork. The manufacturer of a piece of cloth can be sure that one yard of the material will be the same in texture, in weight and in colour to that of other yards on the same roll, but the quarry owner and the marble merchant are not in this happy position.

"Pure statuary," for instance, is frequently inquired for, and by it is sometimes meant statuary of a pure white without marking of any sort. Probably a block of marble which would answer such a description is not in existence and never has been. Absolutely pure carbonate of lime may be obtained by a chemist in the form of a beautiful white powder, but it cannot be obtained direct from nature's own laboratory. The lime is always found mixed more or less with other ingredients, and these form the marks and veins which, if man could be the manufacturer instead of nature, might possibly be eliminated. Then there is the purchaser who asks for bastard statuary without mark. These are none so few as some may think. They belong to two classes. One, those who are altogether ignorant of the trade and terms used in connection with it, and the other those who, knowing the trade and its terms, say one thing and mean another. What these last really mean is first quality statuary at second quality price, or, in other words, a shilling for a threepenny bit.

The careful selection of Sicilian used for monumental purposes cannot be too much insisted upon, but here texture and weather-resisting properties are of infinitely more importance than mere colour or marking. Especially in this climate marble will rapidly disintegrate unless it be of a fine close

texture, even grain, and its chemical composition is such as will insure its preservation against the assaults of our rigorous climate. Here again the difficulties of the quarryman and merchant are considerable. Pure carbonate of lime is rapidly disintegrated by the weather, especially near towns where there is frequently more or less of sulphuric acid in the atmosphere; a good weather stone cannot therefore be white, for the whiter a marble is the more pure is the carbonate of lime of which it is composed. But the colour of the chemical constituents which will preserve the carbonate of lime against the weather is the very thing which is frequently objected to by those who fail to recognise that a weather-resisting stone for memorial purposes is of the first importance, and that all marble bleaches by exposure.

With coloured marbles the difficulty is of another kind. In this case the freaks of nature in points of marking are little objected to, but another demand is made, which the quarry owner is unable to supply. In specifications we frequently read that coloured marble is asked for perfectly sound and free from defects of any sort. There is very little coloured marble in existence which will answer such a description. It is not too much to say that all coloured marble is more or less defective from the point of view of those who style anything but a perfectly homogeneous material a defective one. Indeed, this must be so when we consider the nature of the case. Coloured marbles are formed either by the cementing together of various fragments of different coloured limestones under great pressure, thus forming what is known as brecciated marbles, or by the injection of variously coloured foreign matters into cracks formed in limestone rock. In either case some portions of the material must be less sound than others. The very beauty of the markings and veinings is caused by this fact. A perfectly homogeneous stone may be sound, but it cannot be found with a texture diversified with variously coloured veins and markings.

**DUTY ON BUILDING MATERIALS IN CANADA.**

By the new Canadian tariff, which took effect on April 23, says the *Canadian Architect*, several changes are made in the import duties on building and construction materials; but taken as a whole they are of a moderate character, and are not likely to seriously affect many industries. A feature of the new tariff is the double schedule, framed with the object of giving Great Britain a preference in our markets and of compelling other

**THE WELL-KNOWN FRIEZE,**

ENTITLED

**"THE CORN FIELD."****1. Ploughing.****3. Mowing.****2. Harrowing.****4. Carting.****5. The Products of the Corn Field.***Length, Fourteen Feet Seven Inches by Fifteen Inches deep.***A SPLENDID EXAMPLE OF COLOUR-WORK IN PERMANENT INK PHOTO, BY M. PAUL ALBERT BAUDOIN.***This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.***OPINIONS OF THE PRESS.**

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—THE LADY'S PICTORIAL.

"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—THE STAGE.

"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—THE GENTLEWOMAN.

**AND NUMEROUS OTHERS.**

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

**P. A. GILBERT WOOD, 175 STRAND, W.C.**

May be had framed in Solid Oak Frames with Mounts, at Three Guineas the set of Five Plates.

countries to adopt reciprocal tariffs. This double schedule provides for reducing the import duty whenever any country gives certain concessions to the products of Canada.

Below are shown some of the changes affecting the building trade:—

Portland or Roman cement, from 40 cents per barrel to 12½ cents. per 100 lbs.

Fire brick, from free to 20 per cent. duty.

Copper wire, from 15 to 20 per cent.

Builders' hardware, from 32½ to 30 per cent.

Cotton, linen or rubber fire hose, from 32 to 35 per cent.

Sawn or dressed flagstones, from 30 to 25 per cent.

Floor earthenware tiles, from 35 to 30 per cent.

Glass, ornamented and coloured, painted and vitrified, and rough plate-glass, from 25 to 30 per cent.

Plate-glass, not coloured, in panes not over 12 feet, from 4 cents per square foot to 30 per cent.; over 12 feet and not over 30 feet from 6 cents per square foot to 30 per cent.; over 30 and under 70 square feet from 8 cents per square foot to 30 per cent.; over 70 square feet from 9 cents per square foot to 50 per cent. When bevelled the duty on all sizes is placed at 35 per cent.

Iron hydrants, valves and watergates from 27½ to 25 per cent.

Indiarubber hose from 32½ to 35 per cent.

Rolled iron or steel angles, channels and special sections, weighing less than 35 lbs. per lineal yard, from 35 per cent., but not less than 10 dols. per ton to 7 dols. per ton.

Rolled iron and steel angles, channels and special castings weighing less than 35 lbs. per lineal yard, rolled iron or steel beams, joists, girders, column sections and other building or bridge structural sections not less than 25 lbs. per lineal yard, and rolled iron or steel bridge-plate not less than ⅜ inch thick nor less than 15 inches wide from 12½ to 15 per cent.

Bar-iron, rolled or hammered, squares and bars and shapes of rolled iron or steel, not more than 4 inches in diameter, and flats not thinner than No. 16 gauge, n.e.s., from 10 dols. to 7 dols. per ton.

Iron and structural iron bridges from 30 per cent., but not less than 1 cent per lb. to 30 per cent.

Bridge plate, not less than ⅜ of an inch thick nor less than 15 inches wide, from 12½ to 15 per cent.

Wrought-iron pipe, from 30 per cent. and ½ cent per lb. to 35 per cent.

Cast or wrought-iron, hollow-ware, from 27½ to 30 per cent.

Iron or steel plates or sheets, sheared or unsheared, and

skelp iron or steel, sheared or rolled in grooves, and of all widths thicker than No. 17 gauge, n.e.s., from 10 dols. to 7 dols. per ton.

Iron or steel ingots, coggled ingots, billets and puddled bars, loops and other forms less finished than iron or steel bars, but more advanced than pig-iron, except castings, from 5 dols. to 4 dols. per ton.

Cut nails and spikes of iron and steel, from ¾ cent per lb. to 30 per cent.

Pig-iron, iron kentlege and scrap-iron, from 4 dols. to 2 dols. 50 cents per ton.

Cast-iron pipes, from 10 dols. per ton, but not less than 35 per cent. to 8 dols. per ton.

Manufactures of steel and iron, or parts of iron and steel, from 27½ to 30 per cent.

Lead pipe, from 4 dols. 10 cents lb. and 25 per cent. to 35 per cent.

Manufactures of marble, from 30 to 35 per cent.

Plaster of Paris, calcined or manufactured, from 40 cents per barrel of 300 lbs. to 12½ cents per 100 lbs.

Steam pumps, from 30 to 25 per cent.

Granite, flagstones and freestones, dressed, and all other building stone dressed, except marble, and n.e.s., from 30 to 25 per cent.

Lincrusta Walton wall decorations, from 1½ cents per roll of 8 yards and 25 per cent. to 35 per cent.

Wire cloth of brass or copper, from 20 to 30 per cent.

Iron or steel wire, n.e.s., from 25 to 20 per cent.

In view of the above changes, we give some figures, compiled from the trade and navigation returns of the Dominion, showing the import of several lines of building materials from the different countries, together with value thereof:—

Cement, hydraulic or water lime, from Great Britain, 2,810 barrels; Belgium, 310; United States, 2,680; value, 8,727 dols. Portland or Roman, Great Britain, 93,307 barrels; Belgium, 79,674; France, 11,112; Germany, 12,814; United States, 8,279. Value, 240,388 dols.

Plate glass, Great Britain, 262,562 square feet; Belgium, 155,675; France, 87,855; Germany, 32,265; United States, 1,226; Austria, 7,798. Total value, 149,409 dols.

Lime, Great Britain, 10 barrels; United States, 10,229. Value, 7,331 dols.

Roofing slate, United States, 2,421 squares. Value, 8,274 dols.

Granite, flagstone, rough freestone and other building stone, rough, Great Britain, 854 tons; United States, 13,904. Value,

43,034 dols. Dressed granite and freestone, Great Britain, 439 tons; United States, 370. Value, 11,442 dols.

Cast-iron pipe, from Great Britain and the United States, 43,778 cwt. Value, 47,415 dols.

Bar iron, 67,546 cwt. Value, 121,096 dols.

Fittings of wrought-iron or steel pipe, Great Britain, 33,126 lbs.; Germany, 5,839; United States, 1,304,376 lbs. Value, 68,951 dols.

Iron bridges and structural ironwork, Great Britain, 77,785 lbs.; United States, 1,121,188 lbs. Value, 48,318 dols.

Pig-iron, Great Britain, 6,525 tons; United States, 31,680. Value, 406,916 dols.

Cut nails and spikes, Great Britain, 44,442 lbs.; United States, 710,726. Value, 15,932 dols. Other nails and spikes, wrought and pressed, Great Britain, 133,499 lbs.; United States, 441,322. Value, 20,262 dols. Wire nails, Great Britain, 27,024 lbs.; United States, 241,512. Value, 9,008 dols.

Steam pumps, Great Britain, 10; United States, 203. Value, 39,237 dols.

Rolled iron or steel angles, channels, beams, joists, girders and other bridge structural sections, Great Britain, 93,655 cwt.; Belgium, 5,195; Germany, 80,239; United States, 58,863; France, 212. Value, 270,261 dols.

The arrangement of the duties on cement is rather in favour of Canadian manufacturers, but not to the extent that is generally believed. Under the former tariff the duty was 40 cents per barrel of 375 lbs. The standard barrel of Belgium cement is 350 lbs., therefore the duty under the present tariff of 12½ cents per 100 lbs. would be 43½ cents per barrel, or an increase of 3½ cents. The standard English barrel is 375 lbs., which would make the present duty 47½ cents less a discount of one-eighth under the preferential clause, leaving the duty to be paid on English cement this year at about 41½ cents. But after January 1, 1898, a further reduction of one-eighth is to be given to Great Britain, in which case English cement may be imported under a duty of slightly over 36 cents per barrel, or 4 cents less than the former duty. It would appear from the above that the increased duty required to be paid on importations from other foreign countries may result in the use of greater quantities of cement of English and Canadian manufacture.

The present tariff does not entirely meet the views of Canadian bridge manufacturers. The duty on imported bridges is slightly reduced, while an increase of 2½ per cent. is made on bridge plate, which constitutes the chief imported raw material

of the manufacturers. This increase, however, is not sufficient to seriously affect the Canadian firms.

Manufacturers of heating apparatus view the new regulations favourably. The manufactured goods are now protected from foreign competition by a duty of 30 per cent., an increase of 2½ per cent., while pig-iron, scrap-iron, iron pipe and such materials, which constitute the bulk of the raw material used in the construction of furnaces and radiators, are admitted more liberally than heretofore. Pig-iron, formerly subject to a duty of 4 dols. per ton, is now imported for 2.50 dols., and wrought-iron pipe at 35 per cent., whereas the old tariff on iron pipe was 30 per cent. and ½ cent per lb., which was equal to an additional 30 per cent., making the rate fully 60 per cent. As an offset to the above reduction, the government have increased the bounty to be paid to Canadian manufacturers of iron and steel.

### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

#### APPLICATIONS FOR PATENTS.

13951. John Craw, jun., for "Improvements in door knobs."  
13969. James Somerville, for "Improvements in show-table with adjustable leaves."

13982. John Tingley, for "Improvements in bricks."

14001. William Kelby Lee, for "Improvements in the construction of fastenings for windows."

14048. Henry William Friend, for "Pulley stile sash-retainer."

14054. Peter Liebig, for "Improved flushing apparatus and for water-closets."

14064. Theophil Krah, for "Slaps for covering walls."

14068. Joseph Alfred Fisher, for "Improved fireproof ceilings and partitions."

14121. Alexandre Thomas Williams, for "A simple window fastener."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

# THE NEW EXPANDED METAL

Meshes from 1½ in. to 6 in. wide. Strands from 24 B.W.G. to 3½ in. thickness of steel.

**FOR BUILDING CONSTRUCTION**, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

**FOR SOLID PLASTER PARTITIONS**, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

**FOR FIREPROOF LATHING**, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—cracking or falling away of plaster to be feared.

**FOR CONCRETE FLOORS WITH EXPANDED METAL**.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

**FOR EXTERIOR WALLS OF BUILDINGS**.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

**FOR FENCING, TREE GUARDS, WINDOW GUARDS**, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

**OTHER USES FOR EXPANDED METAL**.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

**BRASS, ALUMINIUM**, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

**CATALOGUES AND PRICE LISTS** can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

**THE EXPANDED METAL COMPANY, LTD.**

**39 UPPER THAMES STREET, LONDON, E.C.**
